Outsourcing Service Delivery in a Fragile State: Experimental Evidence from Liberia

Mauricio Romero (ITAM)
Justin Sandefur (CGD)
Wayne Sandholtz (UCSD)

July 22nd, 2018

NBER-SI

How to improve service delivery in fragile states?

- Give money
  - Bottleneck imposed by state capacity $\rightarrow$ Standard development aid is usually least effective in these places (Burnside & Dollar, 2000; Collier & Dollar, 2002)
- Build state capacity
  - Hard and slow. Efforts to build stronger institutions often fail (Pritchett & Woolcock, 2004)
- Outsourcing provision to sidestep "poor governance"
  - Private management better than public (Bloom & Van Reenen, 2010; Bloom, Sadun, & Van Reenen, 2015)

Theoretical and empirical analyses of outsourcing suggest caution

- Contractors have incentives to cut quality on non-contracted/non-monitored processes/outcomes (Hart, Shleifer, & Vishny, 1997)

- Empirically
  - Better outcomes in some cases (e.g., water services in Argentina (Galiani, Gertler, & Schargrodsky, 2005))
  - Failed in others (e.g., prisons in the U.S. (Useem & Goldstone, 2002))

PPP aims to overcome efficiency/equity trade-off

- Efficiency: Private schools are on average better managed than public schools (Bloom, Lemos, Sadun, & Van Reenen, 2015; Muralidharan & Sundararaman, 2015)

- Equity: Fee-charging private schools may increase inequality and sorting (Hsieh & Urquiola, 2006; Lucas & Mbiti, 2012; Zhang, 2014)

- "Solution": Public funding with private management (and restrictions on selection)

This paper: RCT across 185 schools in Liberia

- Outsource *management* of public schools to private providers
  - 7% of public primary schools and 12% of students
  - Randomly assign treatment at the school level (matched-pairs)
  - Sample students from enrollment records prior to treatment

This paper: RCT across 185 schools in Liberia

- Outsource *management* of public schools to private providers
  - 7% of public primary schools and 12% of students
  - Randomly assign treatment at the school level (matched-pairs)
  - Sample students from enrollment records prior to treatment
- Treatment increases test scores by .19σ after 1 year
- Heterogeneity by provider: Highest=0.26σ, lowest=0
- Contracts matter
  - Removal of students from over-subscribed schools
  - Dismissal of under-performing teachers
- Results reflect additional inputs and different management
  - Non-experimental mediation analysis suggest both mattered

Relation to the Literature

1. **Contracting out public services**
   - Theory: Hart et al. (1997)
   - Empirically: Water (Galiani et al., 2005), health (Loevinsohn & Harding, 2005), education (Aslam, Rawal, & Saeed, 2017)

   $\Rightarrow$ **Contracting out management of public schools**

Relation to the Literature

1. **Contracting out public services**
   - Theory: Hart et al. (1997)
   - Empirically: Water (Galiani et al., 2005), health (Loevinsohn & Harding, 2005), education (Aslam et al., 2017)

   $\Rightarrow$ **Contracting out management of public schools**

2. **Charter schools**
   - Lotteries to overcome endogeneity: Chabrier et. al. (16)
   - Truncated distribution of estimated effects: Tuttle et. al. (12)

   $\Rightarrow$ **Treatment effects: Across all schools and providers**

Relation to the Literature

1. **Contracting out public services**
   - Theory: Hart et al. (1997)
   - Empirically: Water (Galiani et al., 2005), health (Loevinsohn & Harding, 2005), education (Aslam et al., 2017)

   $\Rightarrow$ **Contracting out management of public schools**
2. **Charter schools**
   - Lotteries to overcome endogeneity: Chabrier et. al. (16)
   - Truncated distribution of estimated effects: Tuttle et. al. (12)

   $\Rightarrow$ **Treatment effects: Across all schools and providers**
3. **RCTs**
   - Joint impact of "treatment" *and* the implementing partner

   $\Rightarrow$ **Same program, same country, different implementers**

Relation to the Literature

1. **Contracting out public services**
   - Theory: Hart et al. (1997)
   - Empirically: Water (Galiani et al., 2005), health (Loevinsohn & Harding, 2005), education (Aslam et al., 2017)

   $\Rightarrow$ **Contracting out management of public schools**
2. **Charter schools**
   - Lotteries to overcome endogeneity: Chabrier et. al. (16)
   - Truncated distribution of estimated effects: Tuttle et. al. (12)

   $\Rightarrow$ **Treatment effects: Across all schools and providers**
3. **RCTs**
   - Joint impact of "treatment" *and* the implementing partner

   $\Rightarrow$ **Same program, same country, different implementers**
4. **Service delivery**
   - State capacity: (Ladner & Persson, 2009; Besley & Persson, 2010; Muralidharan et al., 2016)

   $\Rightarrow$ **Outsourcing in the absence of state capacity**

What are "Partnership Schools for Liberia"?

- 93 schools
- free
- non-selective
- staffed by teachers on government payroll
- and managed by 8 private contractors
- with a \$50 per pupil subsidy (+ fundraising)

▸ More details ▸ What do contractors do? ▸ How does this compare to other PPPs?

8 Private providers

- 5 are nonprofit
- 3 are local
- 6 were contracted through competitive tender

▸ More details ▸ What do contractors do? ▸ How does this compare to other PPPs?

Experimental details

- Endogenous participation in lotteries $\not\rightarrow$ population TE
- Uncover implementer-specific treatment effects
- Endogenous sorting of students (supply or demand driven)

Experimental details

- Endogenous participation in lotteries $\not\rightarrow$ population TE
  - Randomize at the school level
- Uncover implementer-specific treatment effects
- Endogenous sorting of students (supply or demand driven)

Experimental details

- Endogenous participation in lotteries $\not\rightarrow$ population TE
- Uncover implementer-specific treatment effects
  - Endogenous sorting of implementers into regions
  - Randomize within the pairs that each implementer accepted
- Endogenous sorting of students (supply or demand driven)

Experimental details

- Endogenous participation in lotteries $\not\rightarrow$ population TE
- Uncover implementer-specific treatment effects
- Endogenous sorting of students (supply or demand driven)

Experimental details

- Endogenous participation in lotteries $\not\rightarrow$ population TE
- Uncover implementer-specific treatment effects
- Endogenous sorting of students (supply or demand driven)
  - Sample students from enrollment records prior to treatment
  - Track them and assign to original schools for analysis (ITT)

Data

- **School:** Facilities, expenditure, management.
- **Teachers:** Socio-demographic, qualifications/experience, knowledge test.
- **Classroom observations:** Stallings
- **Students:** 20 students across all grades (2015/2016 log)
- **Households:** Survey 7-10 HH (only follow ups)

Time-invariant characteristics are balanced and attrition is low

- Time-invariant school characteristics are balanced
- Time-invariant student characteristics are balanced
- Attrition is below 4% and balanced

Outsourcing Service Delivery in a Fragile State

Introduction

Context: Low learning & a weak state

The experiment: Private management of public schools

Results

Final thoughts

Outsourcing Service Delivery in a Fragile State

Empirical specification

$$Y_{isp} = \alpha_p + \beta T_s + \varepsilon_{isp} \quad (1)$$

$$Y_{isp} = \alpha_p + \beta T_s + \gamma X_i + \delta Z_s + \varepsilon_{isp} \quad (2)$$

- Y_{isp}: Outcome for student i in school s and pair p
- α_p: Matched-pair fixed effects (stratification dummies)
- T_s: Treatment dummy
- X_i: Student level controls
- Z_s: School level controls show me
- Clustered *s.e.* at the school-level

Outsourcing Service Delivery in a Fragile State

Test design

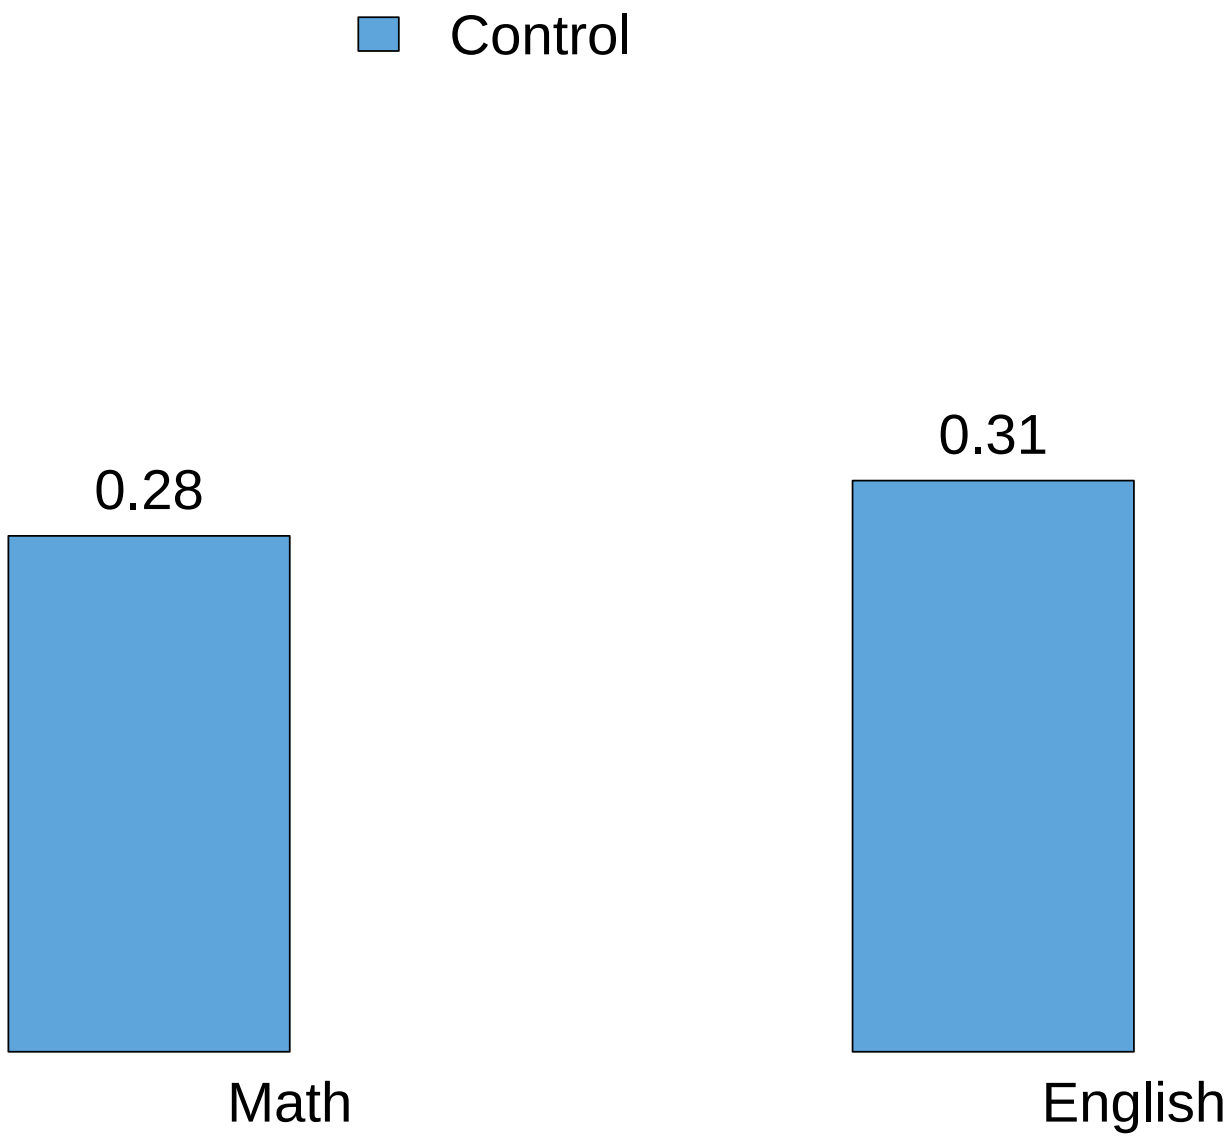
- One-on-one tests
  - Literacy cannot be assumed at any grade level
  - Prevents cheating
- Single adaptive test for all students
  - Capture a wide range of abilities
  - Comparability across grades
- Item response theory (IRT) to estimate student's ability
  - Widely used and "best practice" (GRE, SAT, PISA, TIMSS)
  - Simultaneously estimate the test taker's ability and the difficulty of the questions
  - Comparability across students (if overlap is imperfect)
- Normalize the scores with respect to the control group

Test scores increased by .19σ

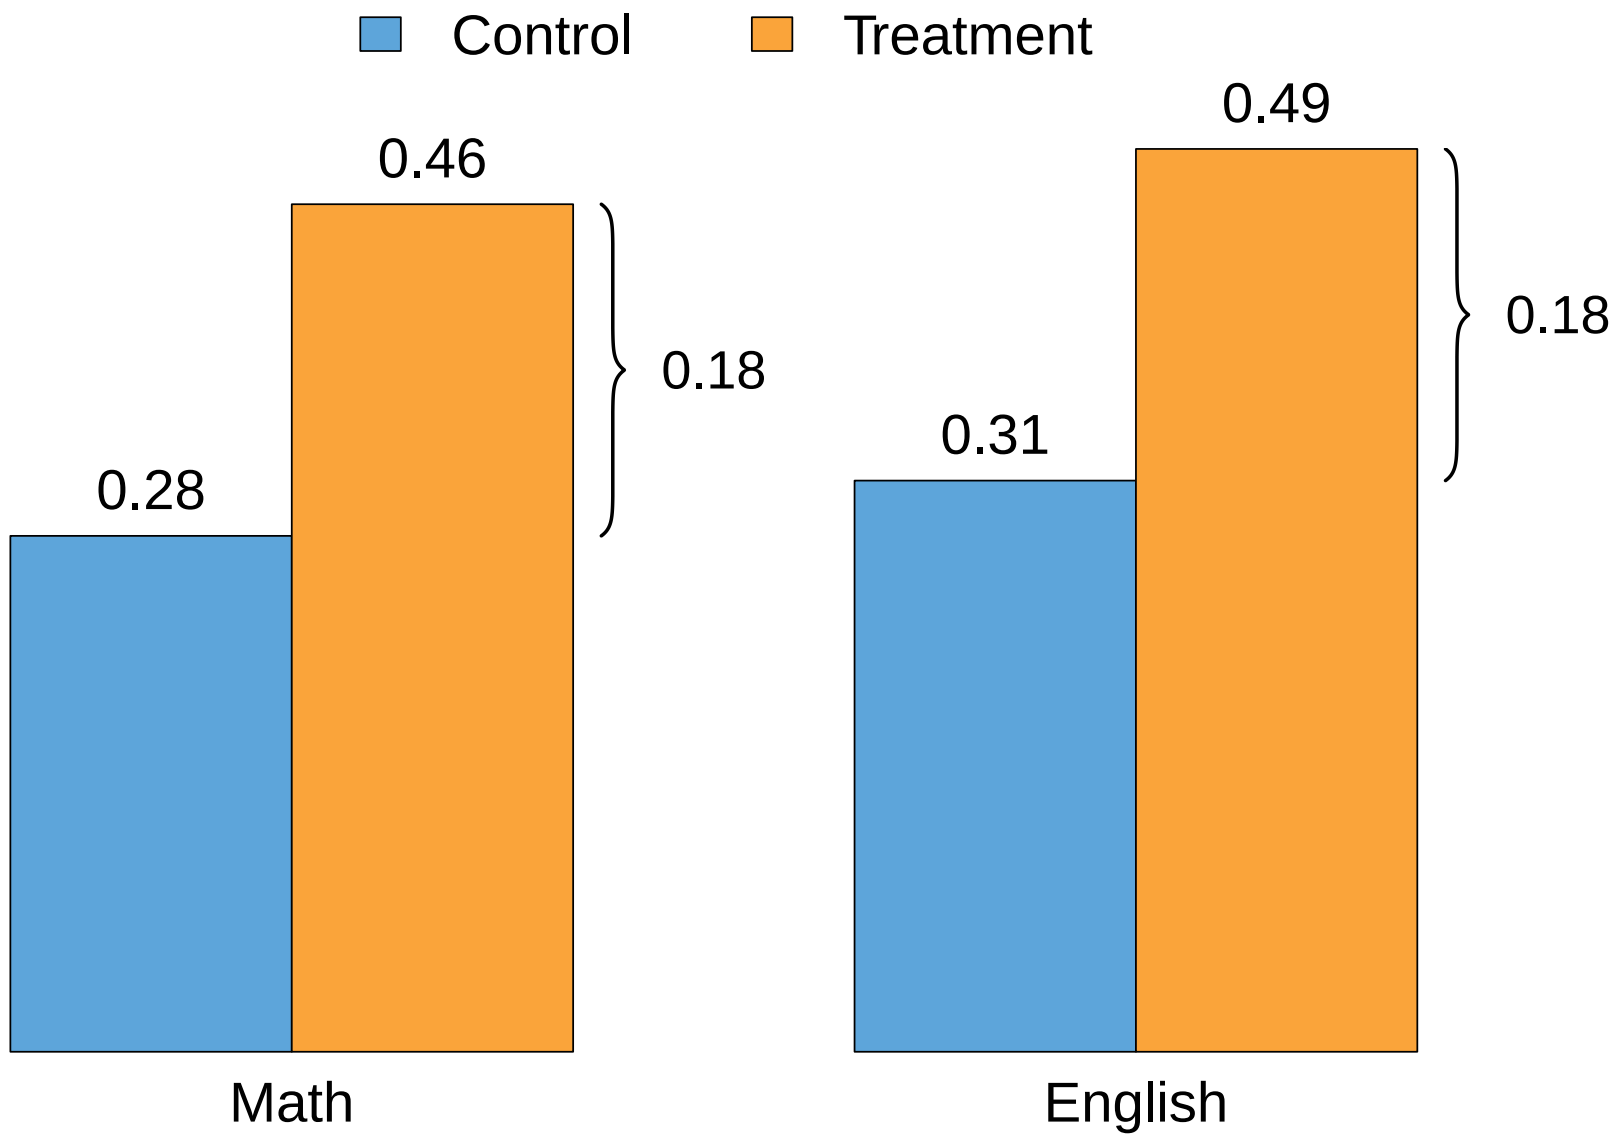
	One year follow-up		
	Difference	Difference (F.E.)	Difference (F.E. + Controls)
	(1)	(2)	(3)
English	0.17**	0.17***	0.18***
	(0.08)	(0.04)	(0.03)
Math	0.17***	0.19***	0.18***
	(0.07)	(0.04)	(0.03)
Composite	0.17**	0.19***	0.19***
	(0.07)	(0.04)	(0.03)
Observations	3,492	3,492	3,492

▸ Teaching to the test? ▸ First wave ▸ Timing ▸ Without Bridge

"Business as usual" learning is $\sim 0.3\sigma$ per academic year



Treatment is roughly ∼0.62 extra years of schooling

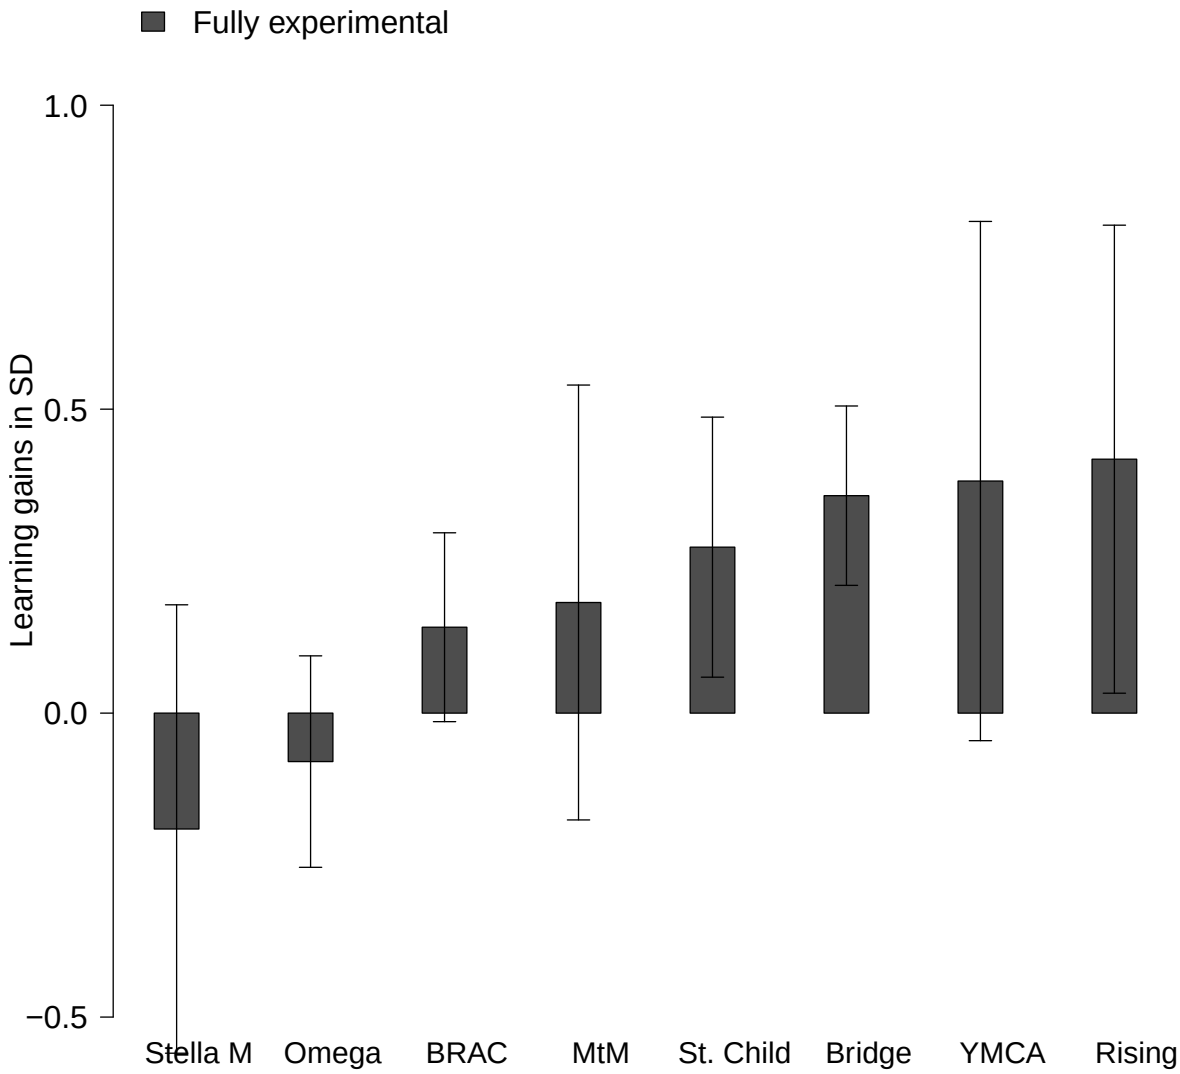


Other outcomes

- No heterogeneity by school characteristics
- No heterogeneity by student characteristics
- No evidence of student selection
- No effect on enrollment (more on this soon)

Outsourcing Service Delivery in a Fragile State

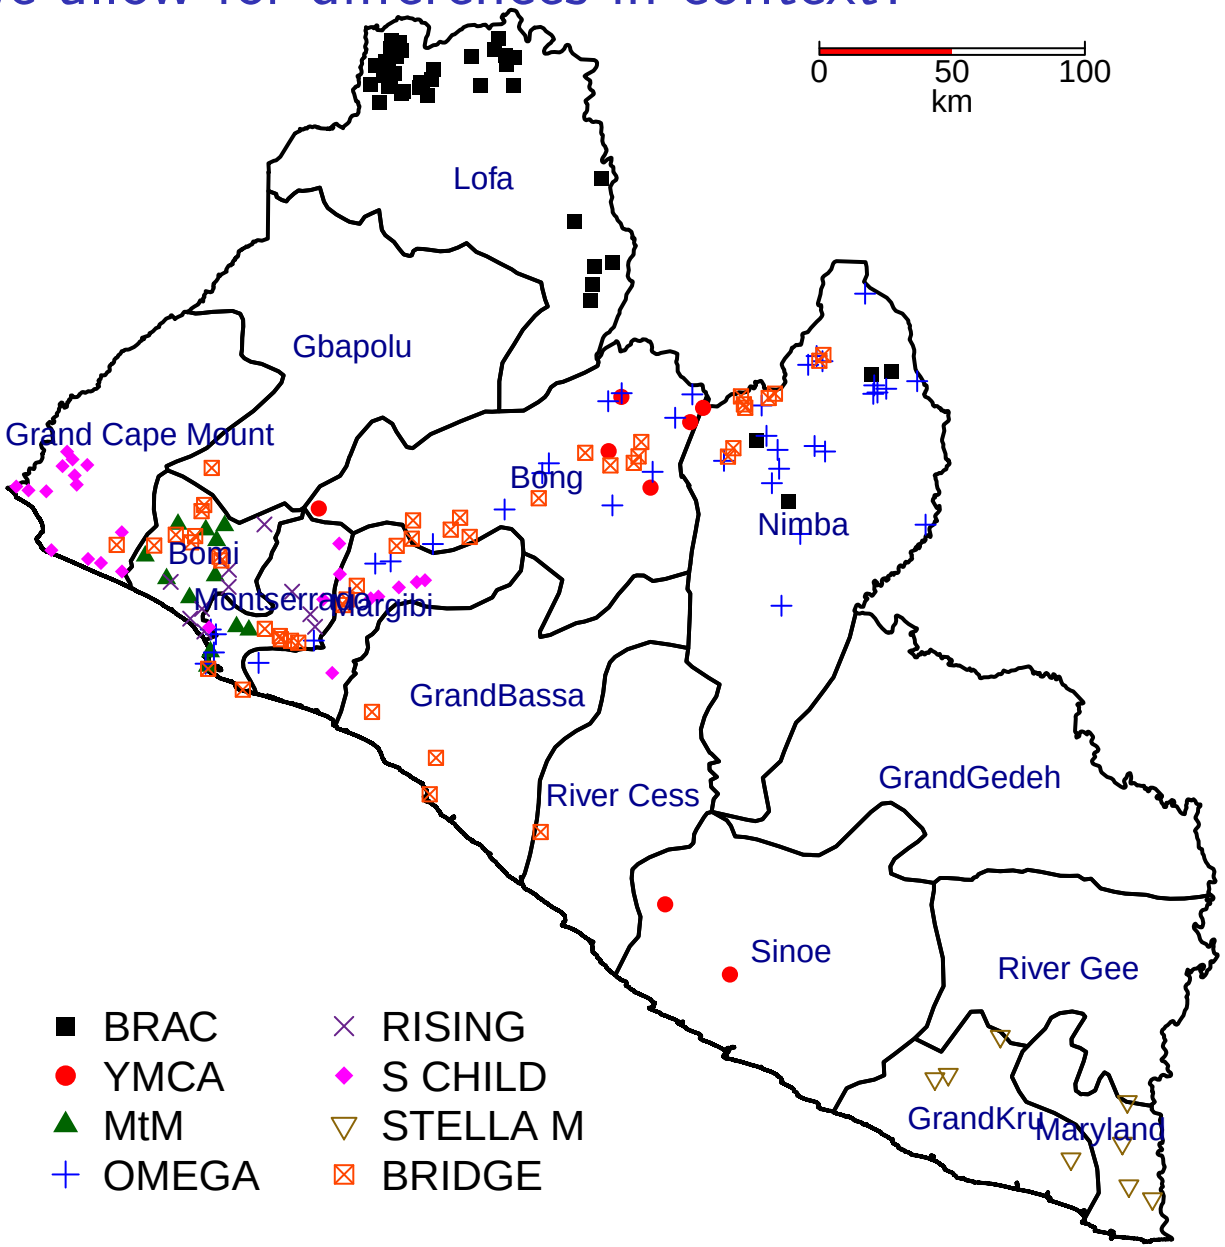
Learning outcomes by provider



Two problems when comparing providers

1. They work in different contexts
    - Raw estimates for each provider are correct (internal validity)
    - But they aren't immediately comparable (external validity)
2. Sample sizes for most providers are small

1. How do we allow for differences in context?

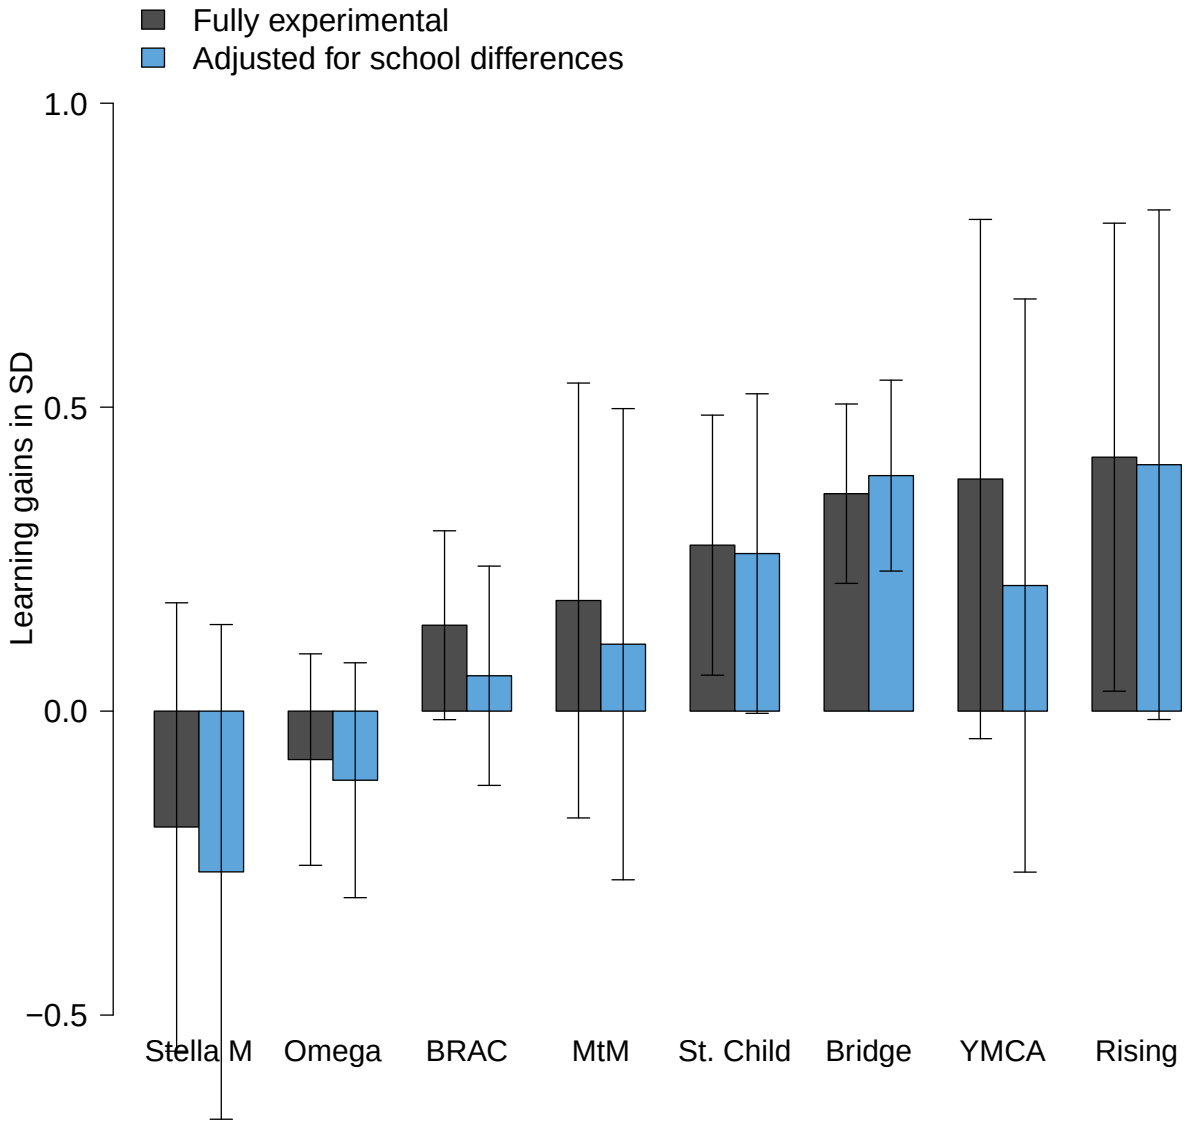


1. How do we allow for differences in context?

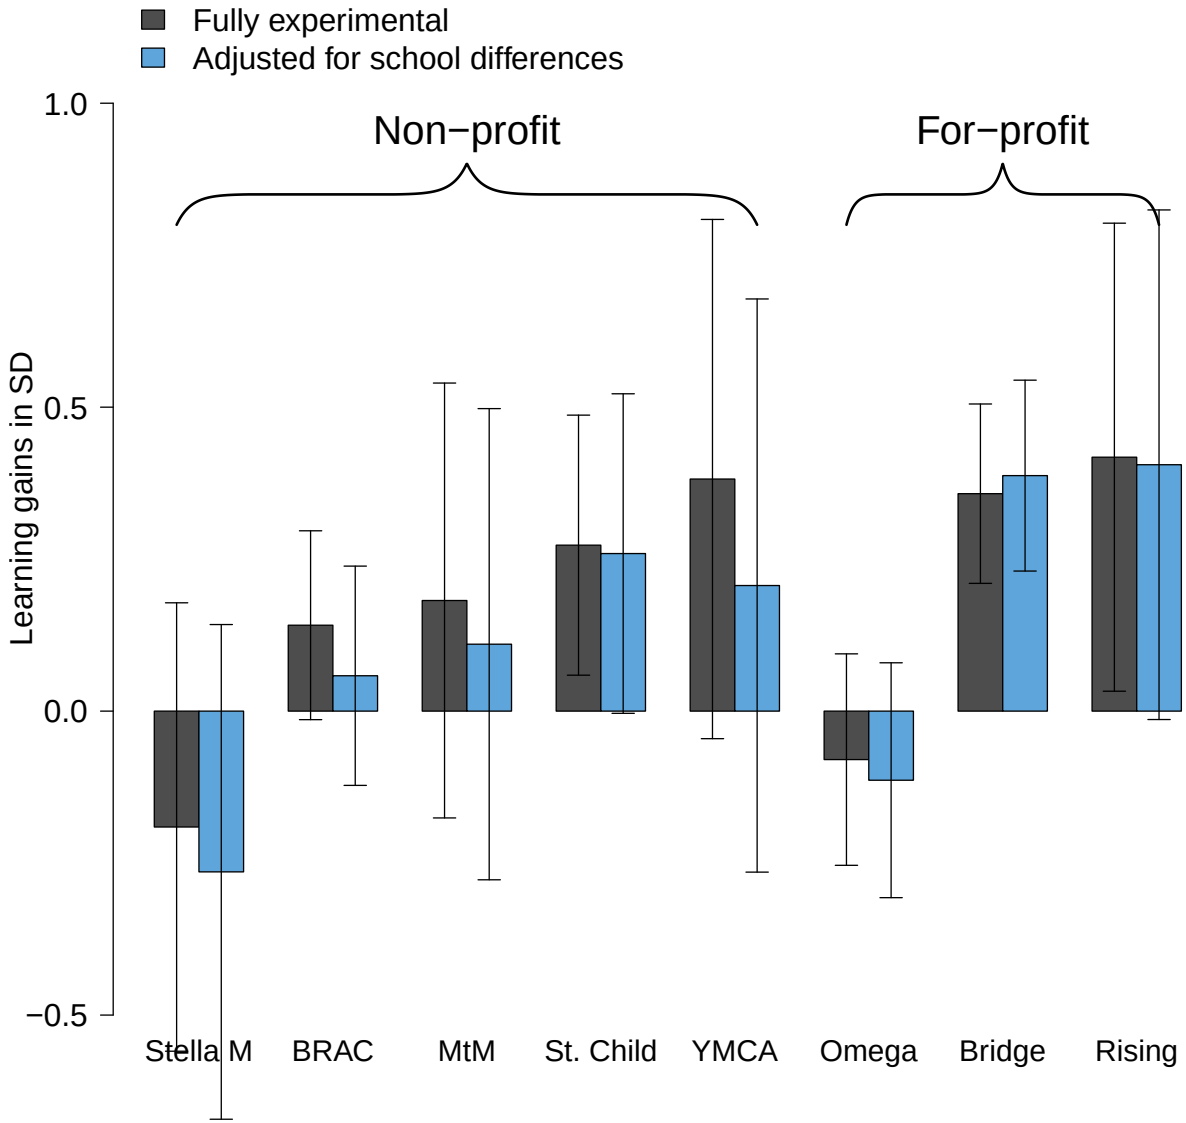
- Control for school characteristics
  - Some schools will score better for reasons unrelated to treatment
- Control for the interactions of characteristics with treatment
  - Raising scores through treatment will be easier in some contexts

▸ Controls

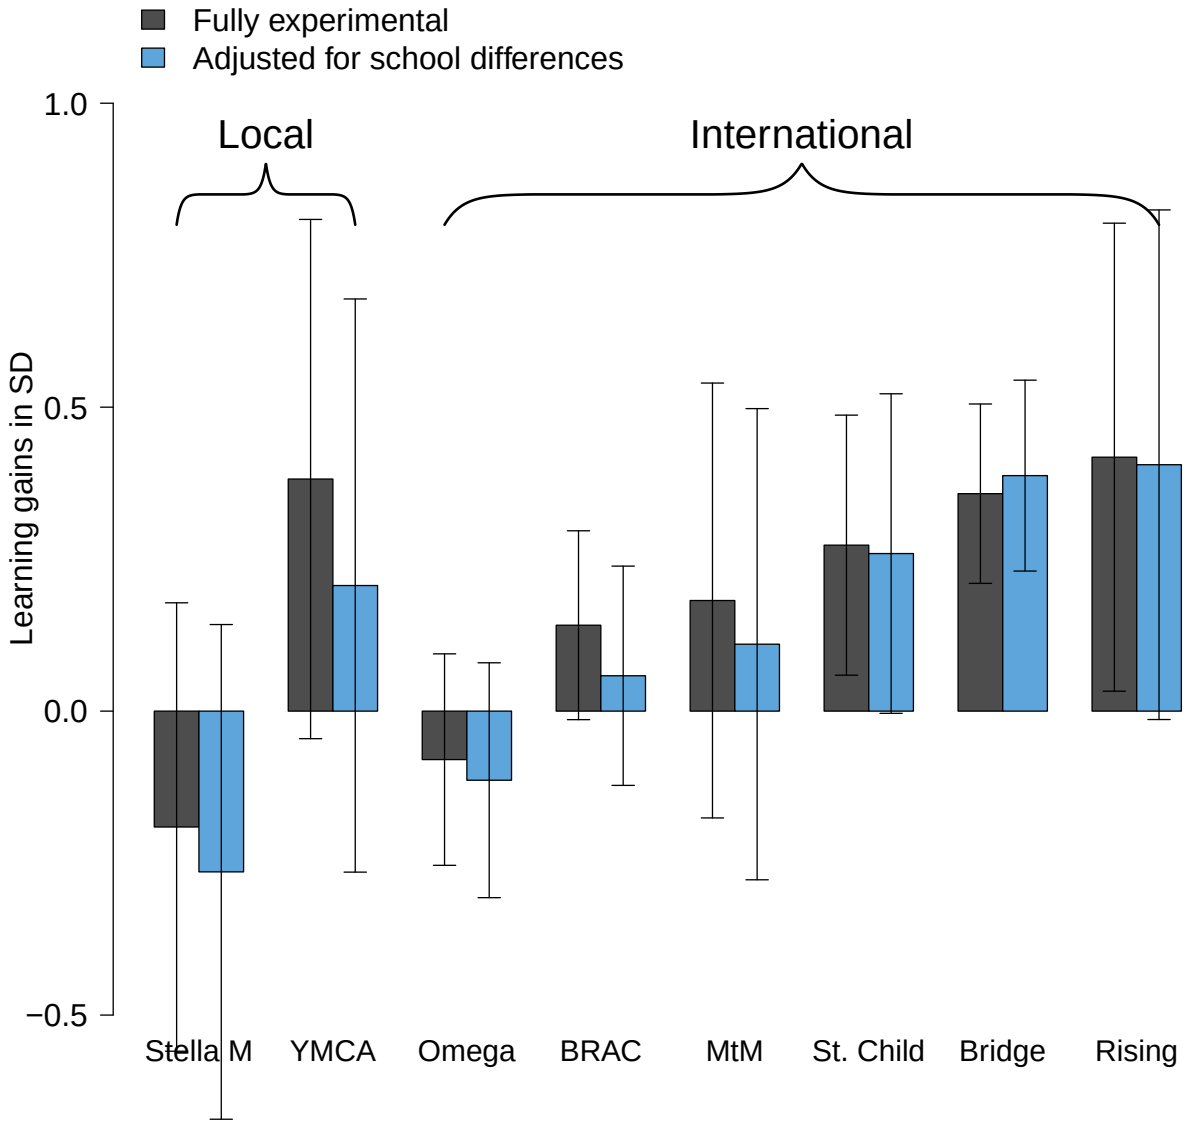
Learning outcomes by provider



Learning outcomes by provider



Learning outcomes by provider

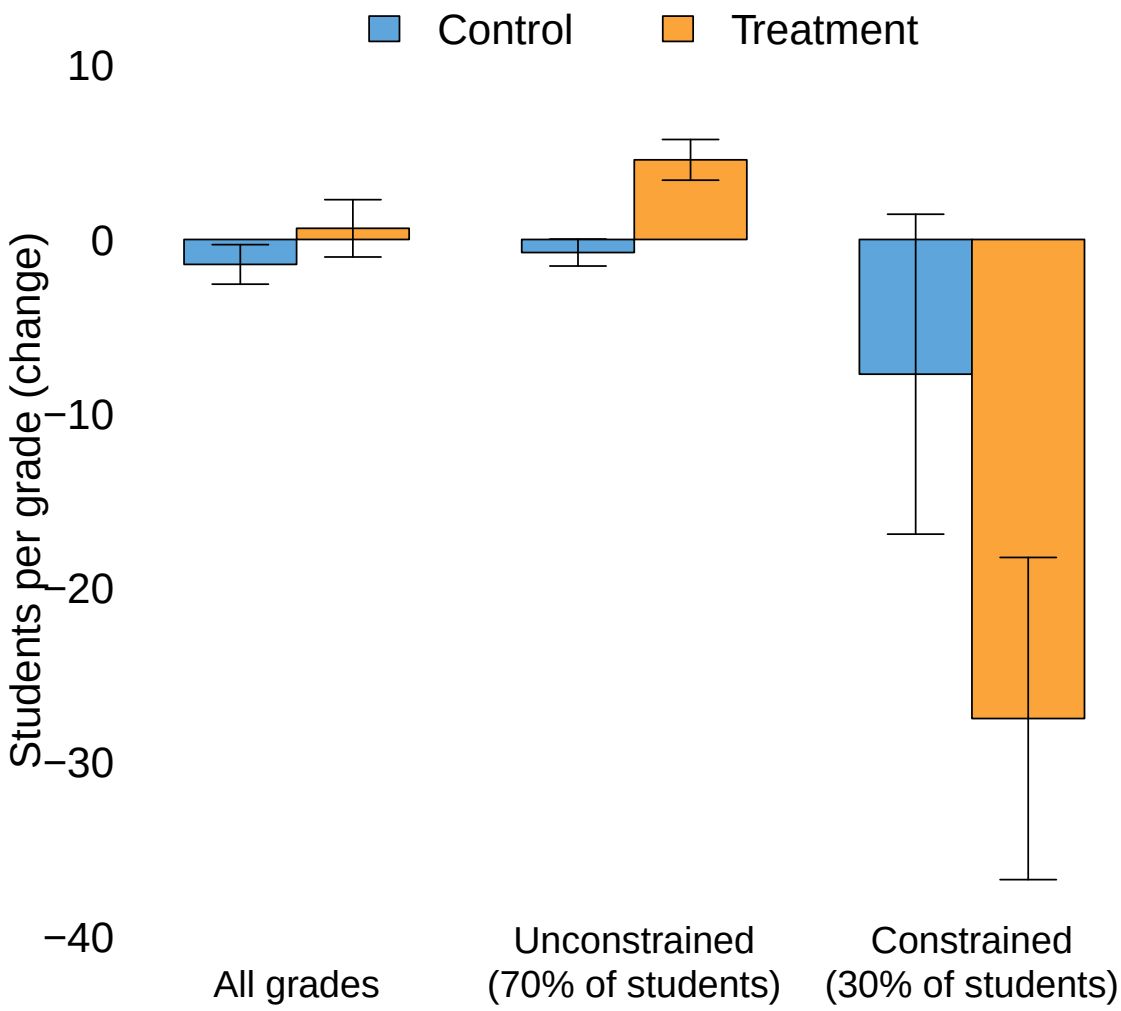


Outsourcing Service Delivery in a Fragile State

Relevant contract details

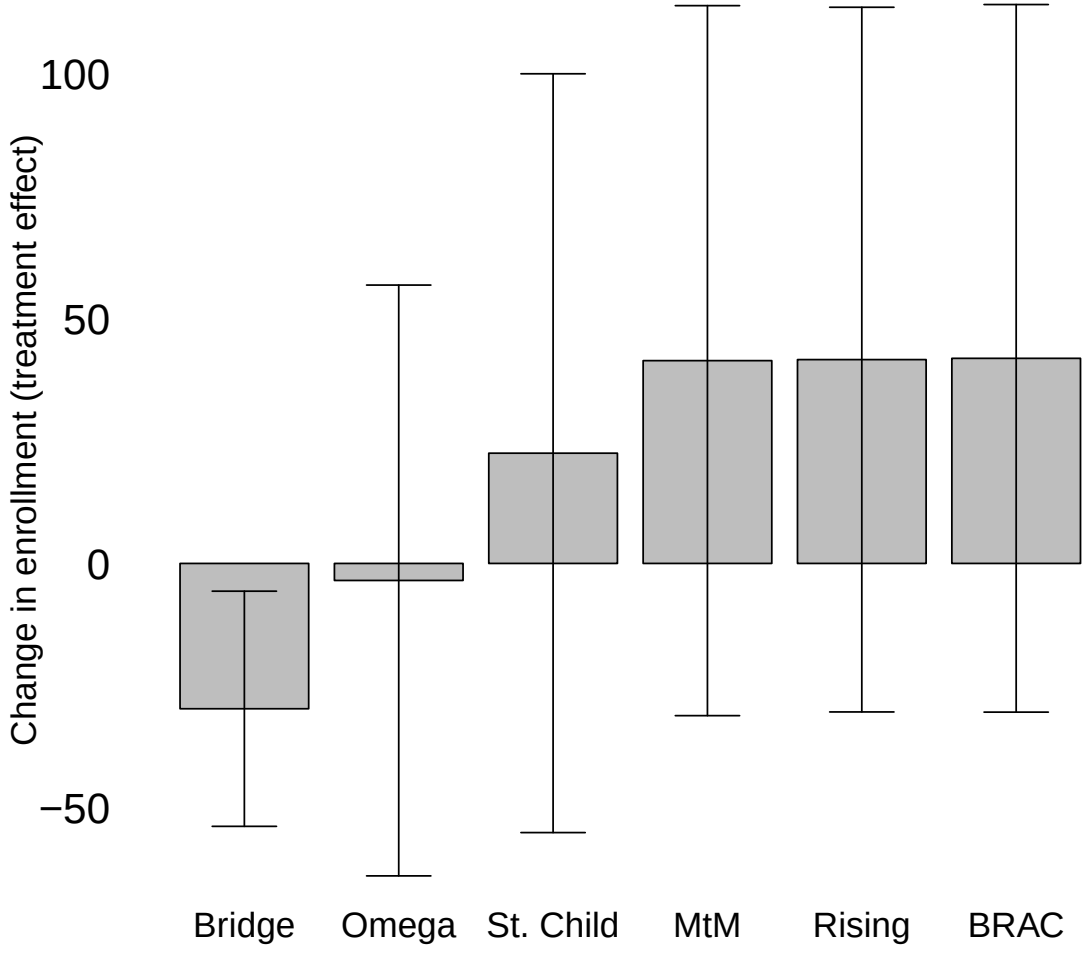
- All contractors allowed to cap class sizes
- Largest provider bypassed the competitive procurement and negotiated a bilateral agreement
  - Lump-sum grants (as opposed to per-pupil funding)
  - Limitations on removing government teachers verbally stipulated (as opposed to written in the contract)

No effect on total enrollment, but in constrained schools enrollment went down

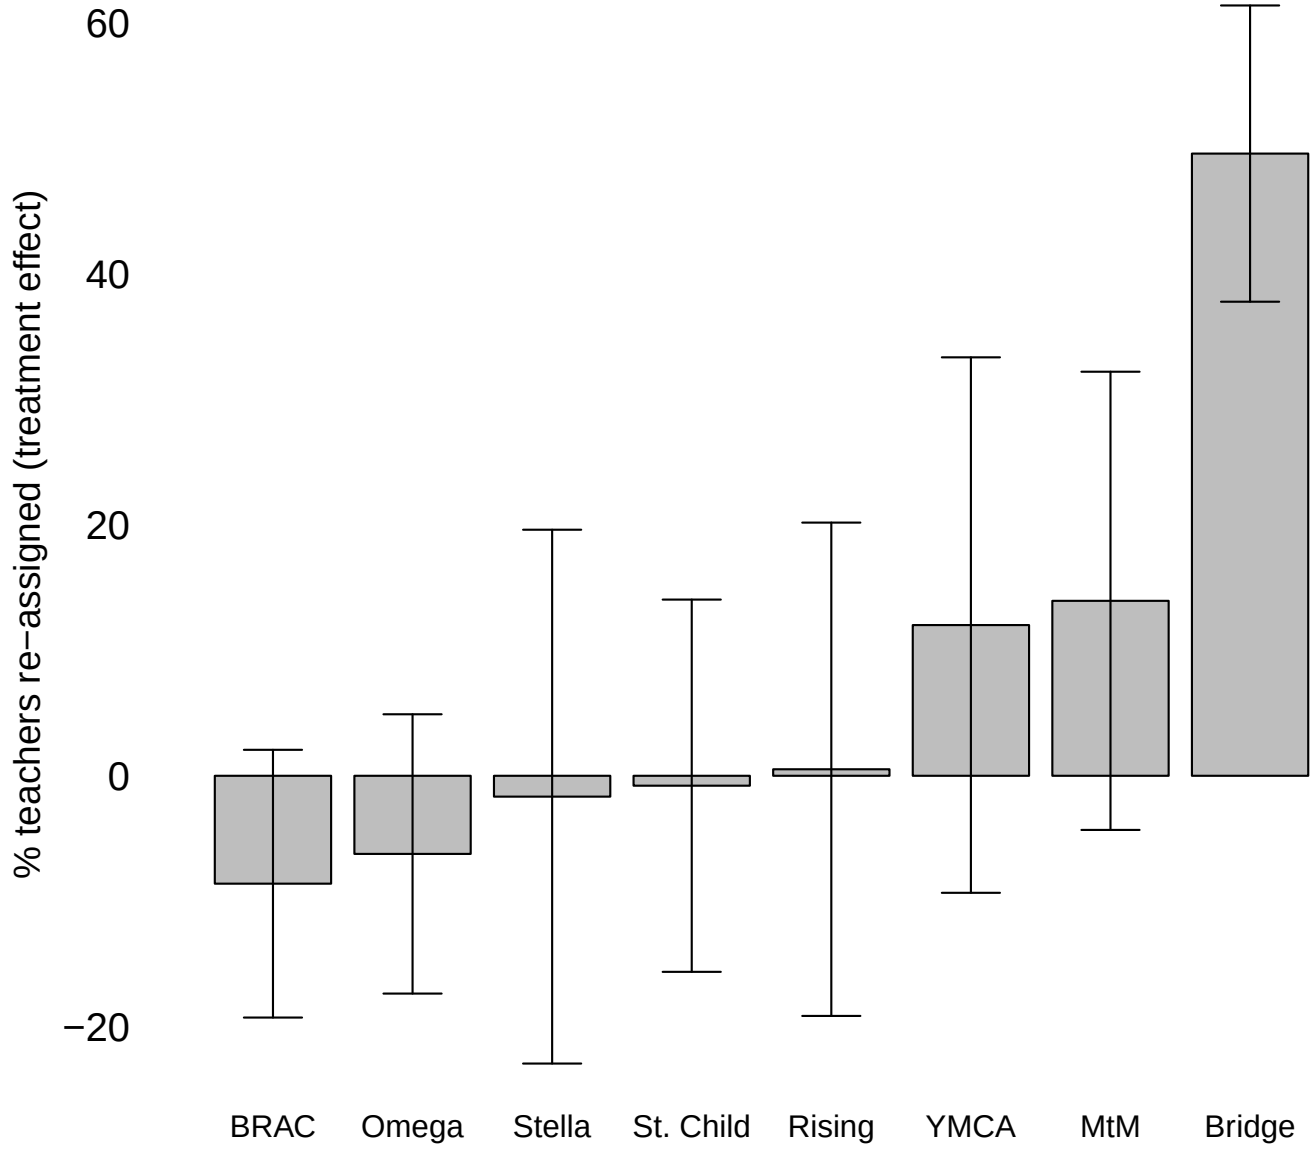


▸ Enrollment table ▸ Constrained table

Removing students from schools where class sizes were large



Removing incumbent teachers



Outsourcing Service Delivery in a Fragile State

What explains learning gains?

- What changed? (Experimental)
- Which changes mattered for learning outcomes? (Non-experimental)

- **Which changes mattered for learning outcomes? (Non-experimental)**

How to choose relevant mediators?

- "Normally impossible to measure all possible mediators. Indeed, it may be impossible to merely *think* of all possible mediators" Bullock and Ha (2011)

- Adding an exhaustive list reduces degrees of freedom

- "Double Lasso" to selects relevant controls (Belloni, Chernozhukov, & Hansen, 2014; Urminsky, Hansen, & Chernozhukov, 2016) ▸ More

  - Lasso #1: What is highly correlated with learning?

  - Lasso #2: What did the experiment change?

Outsourcing Service Delivery in a Fragile State

Introduction

Context: Low learning & a weak state

The experiment: Private management of public schools

Results

Final thoughts

Outsourcing Service Delivery in a Fragile State

Can outsourcing public education raise learning levels in fragile states?

- $.19\sigma$ $\sim$0.62 extra years of schooling
- Highest performing=0.26σ, lowest=0
- Largest provider unenrolled pupils from schools with large class sizes and removed 74% of incumbent teachers
- Questions regarding contracts/procurement
  - Broad statements about PPP may be simplistic
  - Managing/contracting providers requires some state capacity
  - Dynamic contracting — where *apriori* quality is unknown
  - Contracts are incomplete and subject to regulatory capture
  - Mission alignment (Besley & Ghatak, 2005)
  - Competition requires active encouragement

Controls

- School characteristics (per PAP): Enrollment (2015/2016), Facilities (PCA), Rural, Time to nearest bank

- Robust to including different controls

Back

Bayesian hierarchical model

$$Y_{isgc} = \alpha_g + \beta_c treat_s + \varepsilon_{isgc} \tag{3}$$

$$\widehat{\beta}_c \sim N(\beta_c, \sigma_c^2) \tag{4}$$

The Bayesian hierarchal model further assumes that

$$\beta_c \sim N(\mu, \tau^2) \tag{5}$$

1. Place a prior distribution over μ and τ^2

2. Estimate the posterior distribution of β_c

Lasso

1. Standardize variables
2. What mediators are correlated with learning the most (i.e., what explains learning differences?)
3. What mediators are correlated with the experiment the most (i.e., what did the experiment change?)

Each Lasso is estimated via:

$$\widehat{\beta}_t = \underset{\beta}{\text{argmin}} \, ||\mathbb{Y} - \mathbb{X}\beta||_2^2 \text{ subject to } ||\beta||_1 \leq t$$

or alternatively:

$$\widehat{\beta}_\lambda = \underset{\beta}{\text{argmin}} \, ||\mathbb{Y} - \mathbb{X}\beta||_2^2 + \lambda||\beta||_1$$

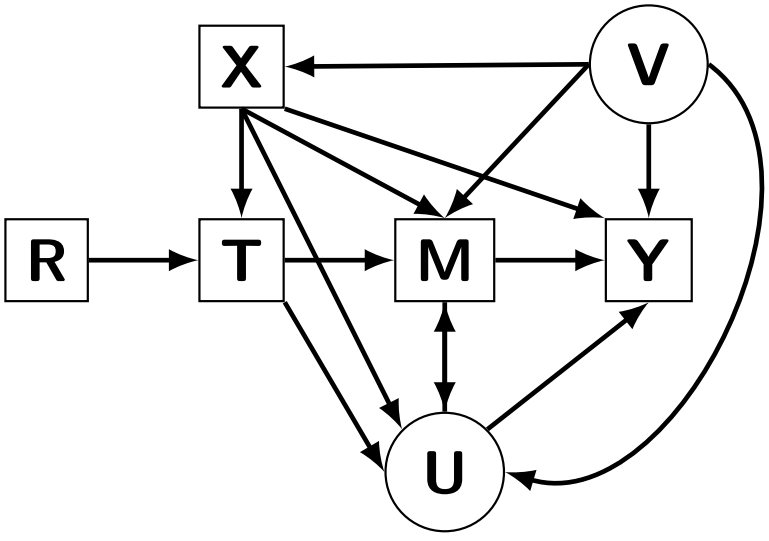
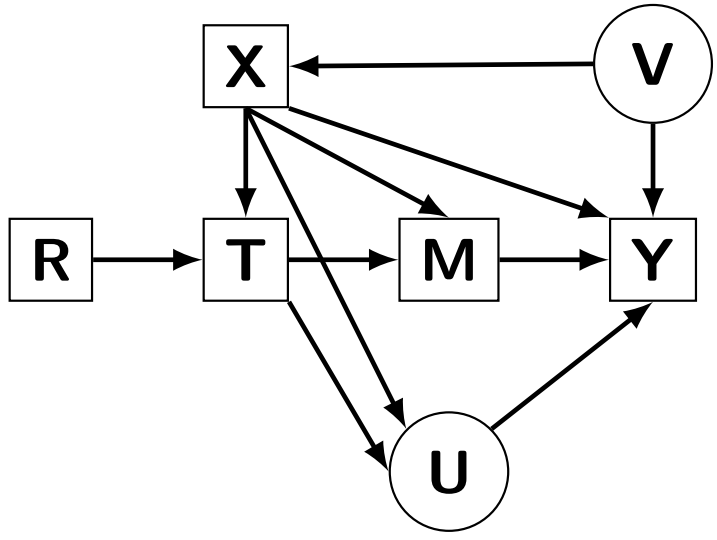
Decompose the treatment effect - Mediation analysis

Causal relationships under different models





Under assumption sequential ignorability

Note: Based on Figure 1 in Heckman and Pinto (2015).

Back

Decompose the treatment effect - Mediation analysis

$$M_{isg} = \alpha_g + \beta_6 treat_g + \gamma_6 X_i + \delta_6 Z_s + u_i \quad (6)$$

$$Y_{isg} = \alpha_g + \beta_7 treat_g + \gamma_7 X_i + \delta_7 Z_s + \theta_7 M_{is} + \varepsilon_i \quad (7)$$

Back

Key assumption

Sequential ignorability (Imai, Keele, & Yamamoto, 2010)]

$$Y_i(t', m), M_i(t) \perp\!\!\!\perp T_i | X_i = x \tag{8}$$

$$Y_i(t', m) \perp\!\!\!\perp M_i(t) | X_i = x, T_i = t \tag{9}$$

Back

Material inputs don't matter, teachers do (and so does teacher attendance)

2. How do we overcome small samples?

- Different providers: Same program
- Bayesian hierarchical model ala Rubin (1981)
- "Pool power" across providers
- Final estimate: Weighted average of providers' ITT and average ITT
  - Proportions depend on provider's sample size
