

MISSING INNOVATIONS

Amitabh Chandra HARVARD BUSINESS SCHOOL HARVARD KENNEDY SCHOOL OF GOVERNMENT and NBER

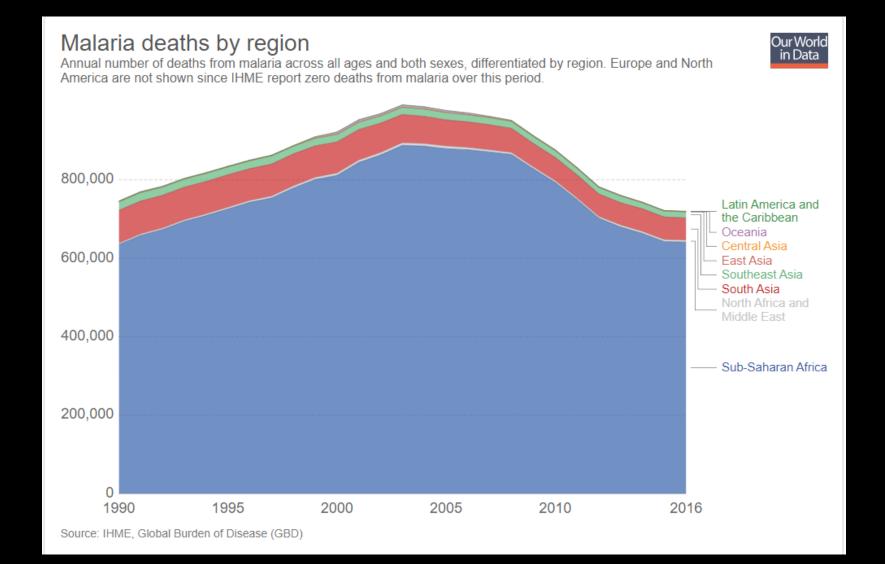

• <u>Malaria</u>

- Mosquito born illness that causes fever, chills and possibly death
- In 2016, 216 million worldwide
- These cases resulted in 445,000 deaths

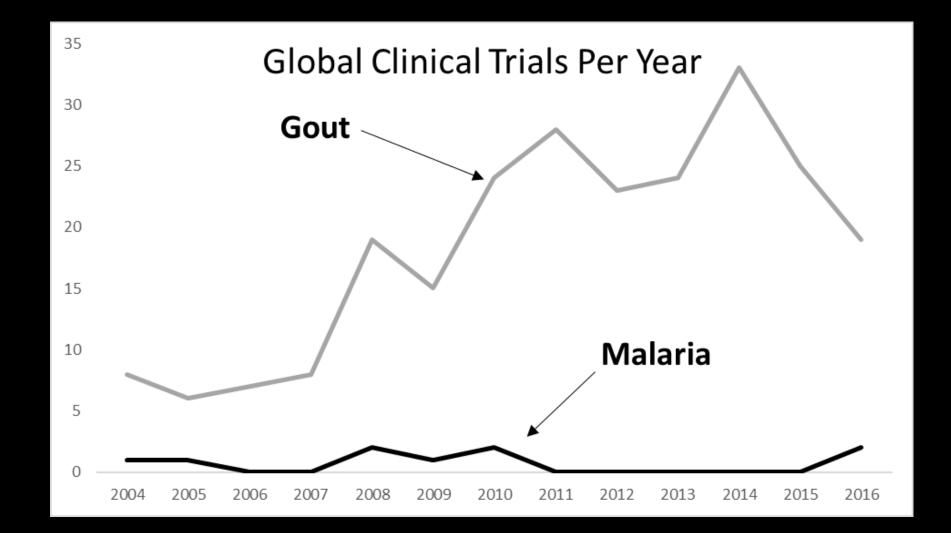

<u>Gout</u>

- Disease resulting in excess buildup of uric acid that causes exceptional joint-pain
- Exacerbated by fatty foods and alcohol
- 34 million cases worldwide

Malaria is not a small disease...

Malaria is not a small disease...but is to financial markets

The RAND Journal of Economics

. . .

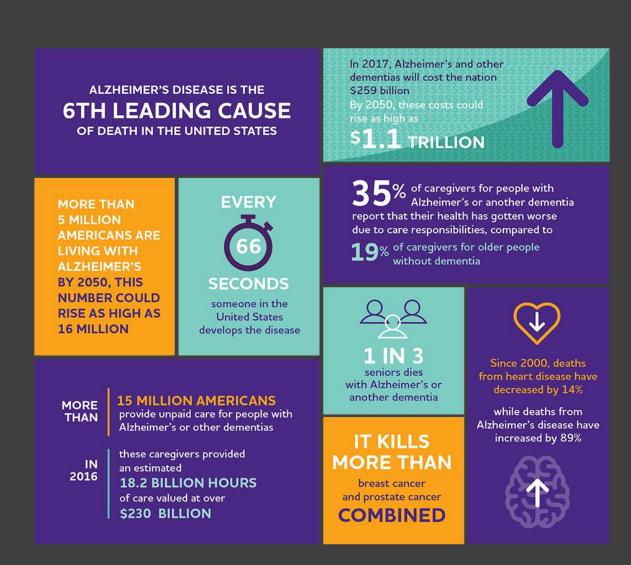

Market Size and Pharmaceutical Innovation

By Pierre Dubois, Olivier de Mouzon and Fiona Scott Morton "This indicates that when a market increases in potential size by 10%, that stimulates a 2.5% increase in the number of treatments to serve that market

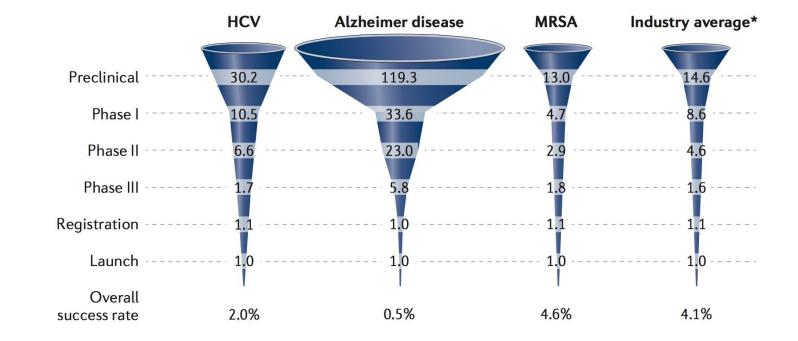

This suggests that, on average, \$2.5 billion is required in additional revenue to support the invention of one new chemical entity."

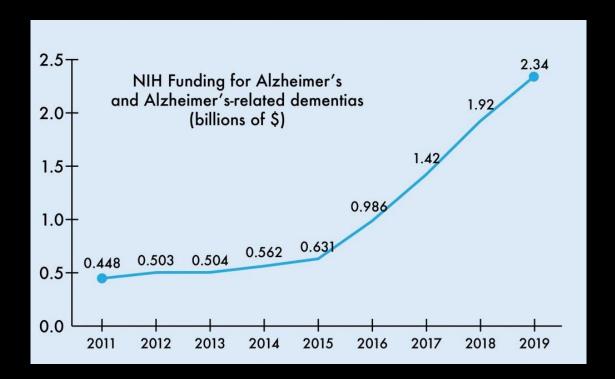

ALZHEIMER's: Amongst the World's Greatest Challenges

- Large Market Size
 - Growing incidence internationally
 - Declining competing risk
 - Demand from caregivers
 - Grey-area diagnosis
- Potential to claim large value-
 - US spending \$500B/year
 - Different than other diseases where new drugs may increase spending

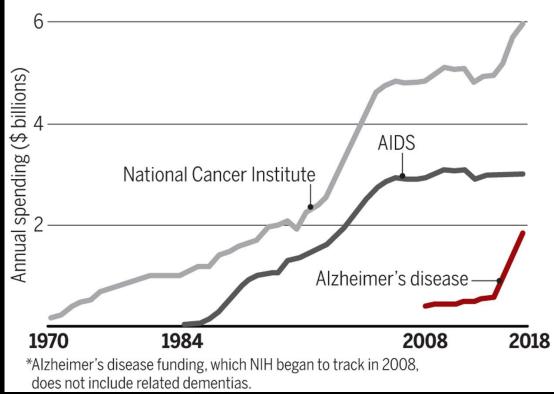

Attrition Profiles Across Therapeutic Areas

Catching up

The National Institutes of Health (NIH) has dramatically ramped up funding for only three specific disease priorities: cancer, AIDS, and, most recently, Alzheimer's.

WHAT INVENTIONS ARE WE MISSING?

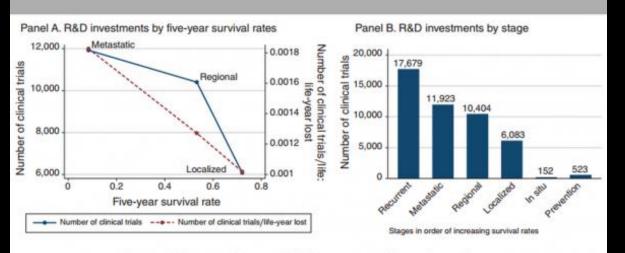

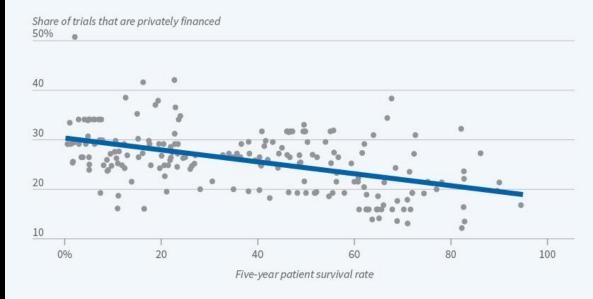

FIGURE 1. SURVIVAL TIME AND R&D INVESTMENTS: STAGE-LEVEL DATA

GROWTH IN GENOMIC AND PROTEOMIC BIOMARKERS

Market Scenarios for Precision Medicine Under Uniform Pricing and Indication-Based Pricing

Lost Einsteins

Lost Einsteins

Low-income children who excel at math rarely become patent holders. They are less likely to hold patents than high-income students who do substantially worse in school.

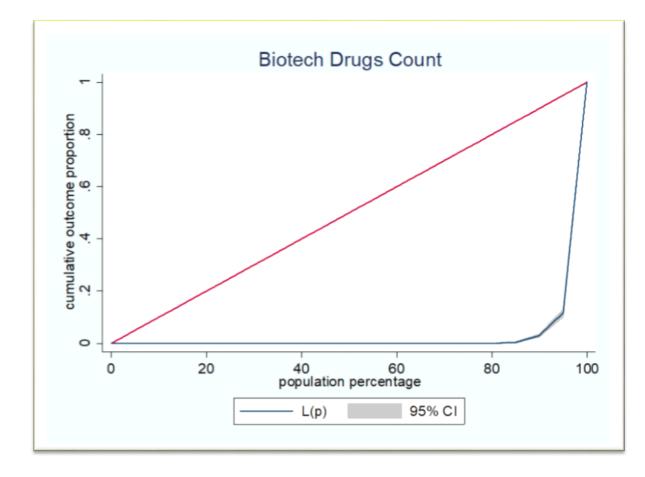

Patents per 1,000 children, by family income and 3rd-grade math performance

	TOP MATH SCORES	LOW MATH SCORES			
Lowest fifth of family income	1.2	0.1			
Second-lowest fifth	2.3	0.1			
Middle fifth	2.5	0.1			
Second-highest fifth	3.4	0.6			
Top fifth of family income	6.5	1.2			
Top math scores are those in the highest 5 percent of all students; low math scores are in the bottom 25 percent. Study analyzed children born from 1980 to 1984.					

Lost Ei	nsteins: Gender			
Patents per 1,000 children, by sex and 3rd-grade math performance				
TOP MATH SCORES		LOW MATH SCORES		
Women	2.4	0.1		
Men	6.0	0.5		

HARVARD BUSINESS SCHOOL

Geographic Concentration of Innovation

Children whose parents were in the top 1 percent of earners were 10 times more likely to be inventors than those whose parents were in the bottom 50 percent. Innovation in the U.S. could quadruple if women, minorities, and children from low-income families became inventors at the same rate as men from high-income families.

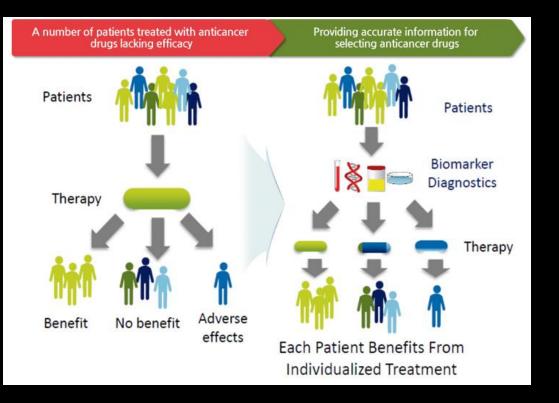

HARVARD BUSINESS SCHOOL

What Innovations are we missing?

- 1. R&D requires **expected economic returns** > investors cost of capital
- 2. These returns depend on
 - Uncertainty and upside risk
 - NIH can reduce (some) uncertainty, but grossly insufficient for Rx Dev
 - IP + exclusivity are key for manufacturers to capture value
- 3. Validated prognostic biomarkers increase effective IP
- 4. Predictive biomarkers induce more innovation: more value capture
- 5. Other pricing models can also help– but negotiation with government is always fraught with classic 'holdup' problem
- 6. There are, poorly understood, non-price barriers to innovation: missing Einstein's and geography

NOW A REALITY: THE FIRST FDA-APPROVED GENE THERAPY FOR A GENETIC DISEASE

LUXTURNA is a prescription gene therapy product used for the treatment of patients with inherited retinal disease due to mutations in both copies of the *RPE65* gene, which can only be confirmed through genetic testing. You must also have enough remaining cells in your retina (the thin layer of tissue in the back of your eyes) as determined by your healthcare professional.

Incentives for Orphan Drugs

Country	Year adopted	Threshold for orphan drug status	Market exclusivity	Financial support for R&D
US	1983	Fewer than 200,000 patients in the U.S. (6 in 10,000)	7 years	Tax credits of 25% of R&D costs
Japan	1993	Fewer than 50,000 patients in Japan (4 in 10,000)	10 years	Up to 50% of R&D costs, plus 6% tax credit
European Union	2000	Fewer than 5 in 10,000	10 years	Varies across member states

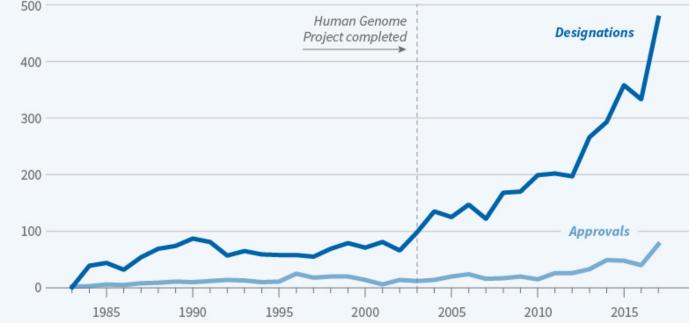

Are these incentives too generous?

- 1. Changes in pricing dynamics including indication-based pricing have decreased threshold for an economically viable product
- 2. Firms increasingly seek multiple orphan indications for products, and often those products were approved for existing non-orphan indications.
- 3. Small size of patient populations targeted for orphan designations has created a set of natural monopoly-like conditions
- 4. Changes in the technology of drug development surrogate endpoints and faster approvals-- may have_lowered the cost of R&D

Incentives for RARE DISEASE R&D

- Firms undertake R&D as long as expected profits exceed a threshold
- Expected profits will be small for rare diseases

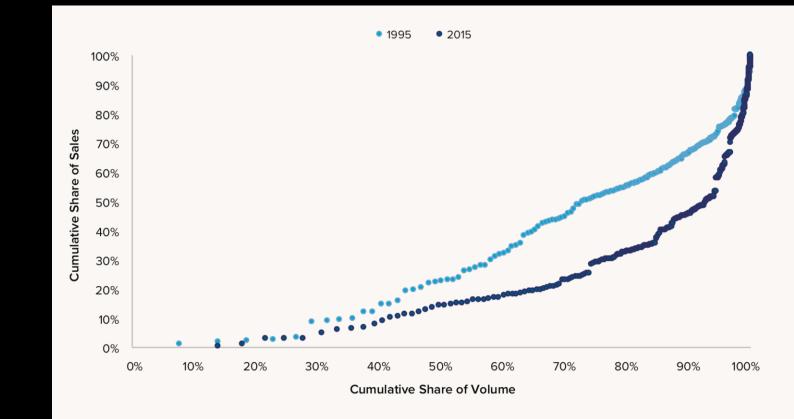

'Orphan Drug' Designations and Approvals, 1983–2017

"Orphan drug" designations and approvals

"Orphan drugs" are products aimed at treating conditions afflicting fewer than 200,000 patients. "Designations" are regulatory acknowledgments that are a necessary precursor to developing an approved orphan drug.

Source: Forthcoming in J. Lerner and S. Stern, eds., Innovation Policy and the Economy, Volume 19, University of Chicago Press

Note: Volume is represented in standard units Source: QuintilesIMS MIDAS, Sep 2016; QuintilesIMS Institute, Jul 2017

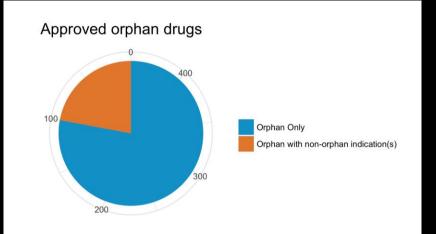

CHANGING PRICING DYNAMICS

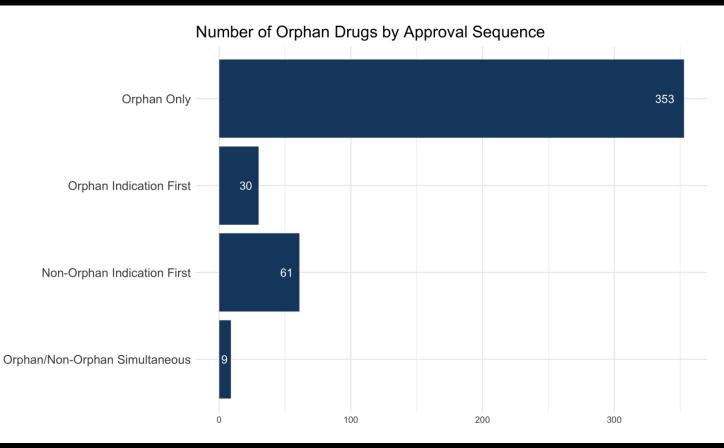

Table 1Potential Prices by Indication				
	Median Survival Gain, years ¹	Typical Treatment Duration, months ¹	Uniform MonthlyPrice ¹	
Erbitux				
Locally advanced squamous cell carcinoma of the head and neck	1.64	1.39	\$10,319	
First-line treatment of recurrent or metastatic squamous cell carcinoma of the head and neck	0.23	4.16	\$10,319	
Herceptin				
Adjuvant treatment of breast cancer	1.99	12	\$5,412	
Metastatic breast cancer	0.4	10	\$5,412	

Source: Bach et al., 2015; authors' calculations in last column

Note: Indication-based price is calculated as the price that would be charged if patients value their life to the same degree as patients with the least effective, but still covered, indication. For Erbitrux, this implied value of a life-year is approximately \$ 186,639 (in the low-value condition, payers are willing to cover 4.16 months of treatment at a monthly price of \$10,319 for a survival gain of 0.23 years). The indication-based monthly price in the high-value condition for Erbitux will be \$220,208 (\$186,639 per life-year x 1.64 years of survival / 1.39 months of therapy).

ORPHAN DRUGS with NON-ORPHAN INDICATIONS

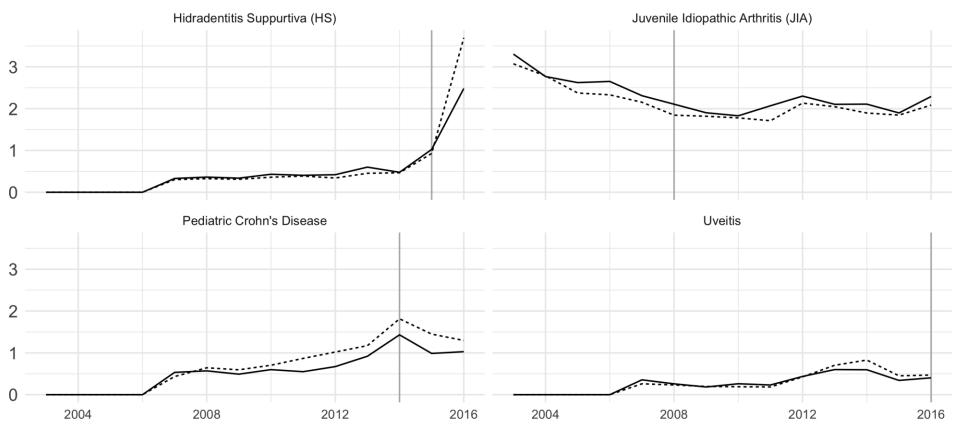

HUMIRA: a case-study

Date	Indication	Date	Indication
12/31/02	Rheumatoid arthritis	2/21/08	Juvenile idiopathic arthritis
10/3/05	Psoriatic arthritis	9/28/12	Ulcerative colitis
7/28/06	Ankylosing spondylitis	9/23/14	Pediatric Crohn's disease
2/27/07	Adult Crohn's disease	9/9/15	Hidradentitis suppurtiva (HS)
1/18/08	Plaque psoriasis	6/30/16	Uveitis

Percent of total Humira spending and use

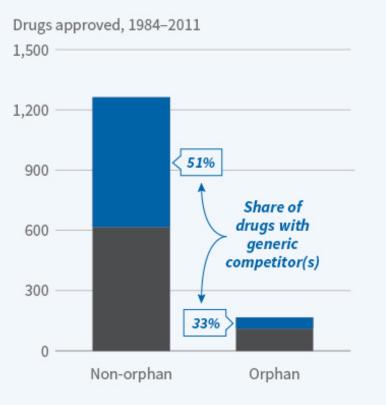

By orphan indication

---- Percent of persons filling prescriptions ---- Percent of spending

Each orphan indication is marked in the year of approval. Spending for each indication is reported as zero in years where ten or fewer persons were identified with the particular indication.

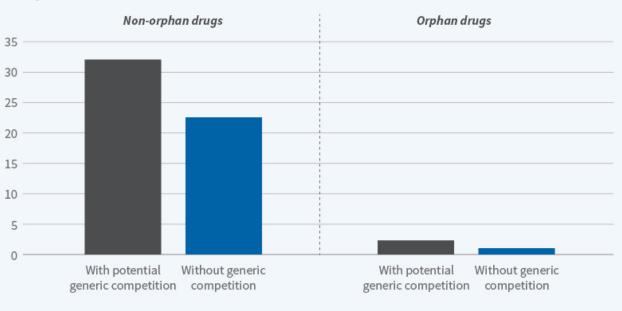

Generic Competition among Orphan and Non-Orphan Drugs

Data pertain to small molecule drugs Source: Forthcoming in J. Lerner and S. Stern, eds., Innovation Policy and the Economy, Volume 19, University of Chicago Press

Demand for Pharmaceuticals with Generic Competition and Without

Average pharmacy claims in peak year between 1992 and 2017 (000s)

"Orphan drugs" are products aimed at treating conditions afflicting fewer than 200,000 patients. Source: Author's calculations based on data from OptumLabs

Incentives for orphan-drugs require two determinations:

Which Products? Provide bigger incentives to products with little market potential and smaller incentives for those that are close to viability. Note that with biomarkers, vast majority of orphan drugs will command high prices with or without ODA

How to Structure? R&D Tax Credit is funded though general revenues; but orphan-exclusivity is a fee on patients with orphan diseases.

- Tax-credit is superior than orphan exclusivity: US may have moved in the wrong policy direction recently
- EU law allow a reduction of the exclusivity period when a drug is deemed sufficiently profitable. In Japan, manufacturers must repay R&D subsidies for drugs with annual sales that exceed a cutoff

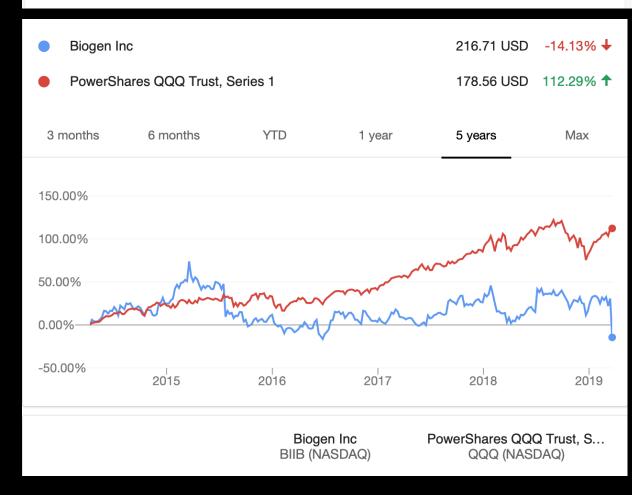

A Role for Regulation? Perhaps use "cost based price regulation" for Rx that received ODA protections after exclusivity periods have run out?

HOW TO WIN

An Uphill Battle Imagine leading an expedition where every step is more difficult than the last...

The long journey begins in the lab, where scientists spend years testing thousands of ideas. Next, crossing the so-called "Funding Valley of Death" requires the resources and time needed to complete clinical trials, testing safety and effectiveness among what could end up being thousands of volunteers. At the end of this steep financial and scientific climb: Food and Drug Administration approval for a new treatment. Ultimately, it may have taken up to 15 years and more than \$1 billion to bring this treatment to the market.

Although we are using the word "treatment," clinical trials also involve medical research studies in which people participate as volunteers to test new methods of prevention, screening, and diagnosis of disease.

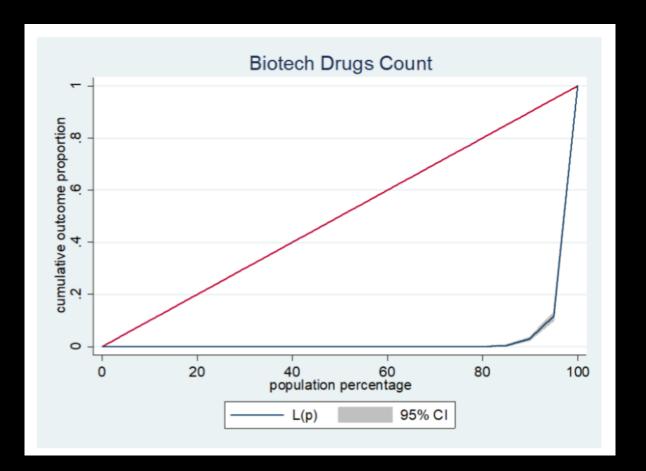

2 After approval, the product is manufactured for sale on the market, and the process enters Phase 4 (Post-Marketing Monitoring/Clinical Trials). At this point, the FDA monitors for public safety and adverse events, and the sponsor company may begin Phase 4 Clinical Trials to obtain information about long-term effects or to test the product in special patient populations.

3 The "Funding Valley of Death" is the financial challenge many promising treatments face in having the opportunity to be scientifically tested in a clinical trial. In many cases, further financial support or partnerships are necessary to proceed.

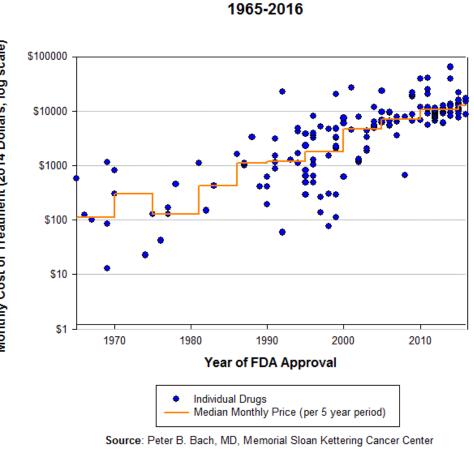

* The cost of bringing a drug to market depends on a number of variables, but could be more than \$1 billion, including approximately \$50-840 million for Basic Research/Drug Development and Pre-Clinical/Translational research, and approximately \$50-970 million to complete all three Phases of the Clinical Trials.

Translational Research

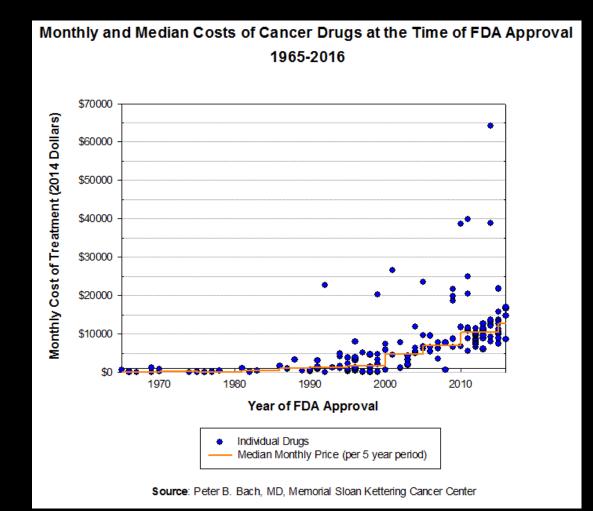

Concentration of Innovation

Attitude	Percentage of Responses
Health care costs as a national priority	
Reducing health care costs should be a top priority for President Trump and Congress in 2019†	69
Health priorities for the new Congress (top 5 from a list of 13; % saying "extremely important" priority):	
Lowering prescription-drug prices	92
Making sure insurance companies must still provide health insurance for preexisting conditions	91
Making sure Medicare benefits are not cut back	88
Lowering the overall cost of health care	88
Increasing spending on research to find cures for diseases	85
Reasons for high health care costs	
Reasons for rising health care costs (top 5 from a list of 12; % saying major reason)‡‡	
Drug companies make too much money	78
Hospitals charge too much	71
There is too much fraud and waste in the health care system	71
Insurance companies make too much money	70
New drugs, treatments, and medical technologies are often very expensive	62

NOVEL SOURCES OF VALUE

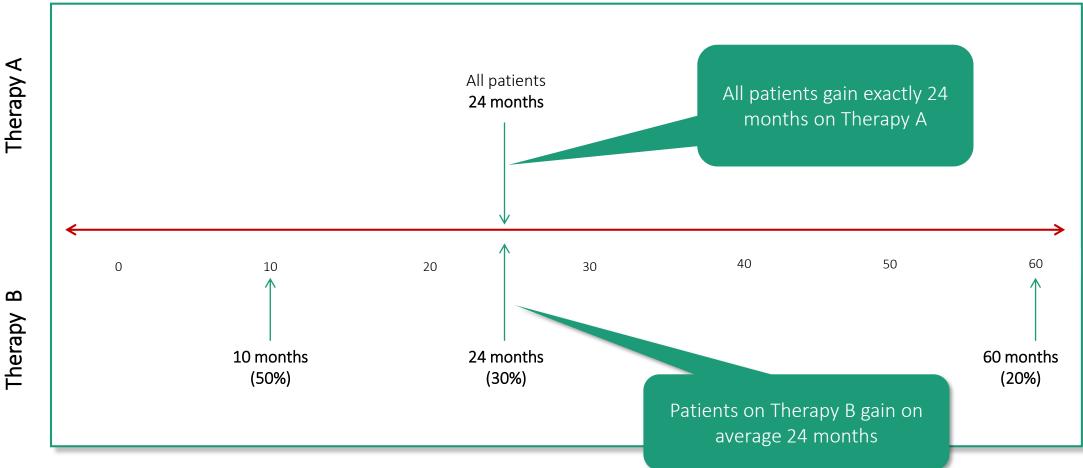

DESPERATELY SEEKING SURVIVAL

Patients generally respond well to targeted therapies (left), which are directed at specific mutations in a cancer, but only for a short time. Checkpoint immunotherapies (right) do not help as many people, but those they do help tend to live longer. Oncologists are trying to get the best out of both strategies by combining the drugs.

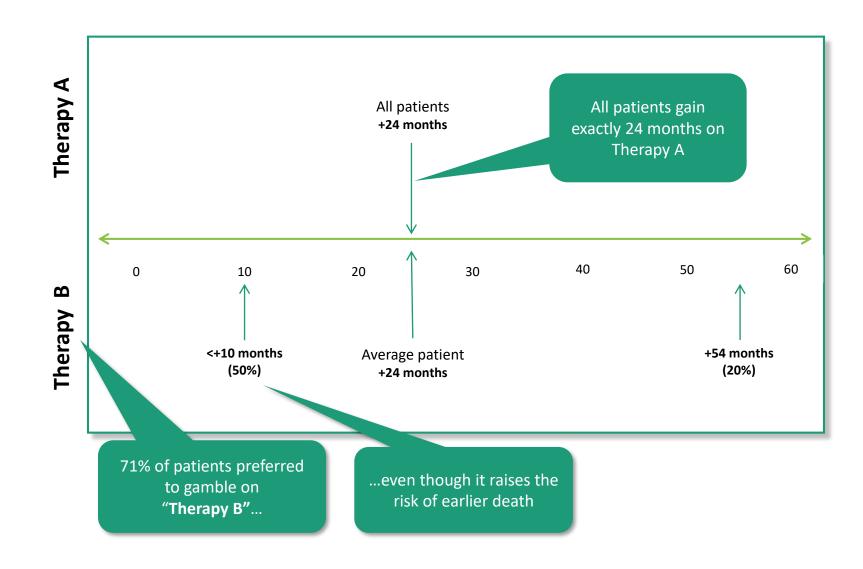

VALUE OF HOPE: SKEWNESS IN PATIENT OUTCOMES

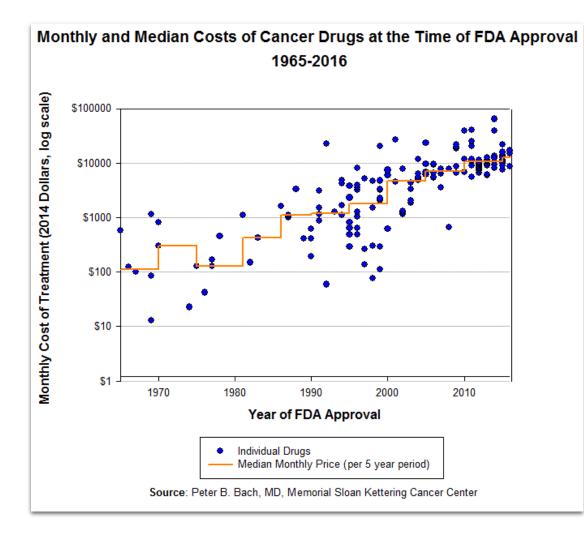

Illustrating the Value of Hope: Which Therpay Would You Choose?

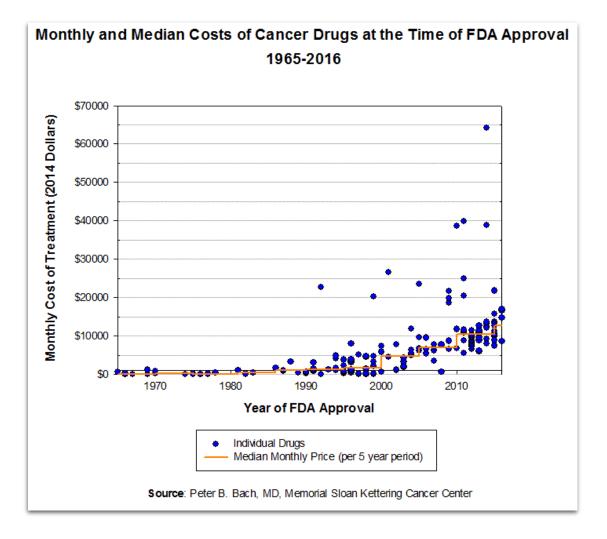

"Hopeful" Therapy a Popular Choice for Patients

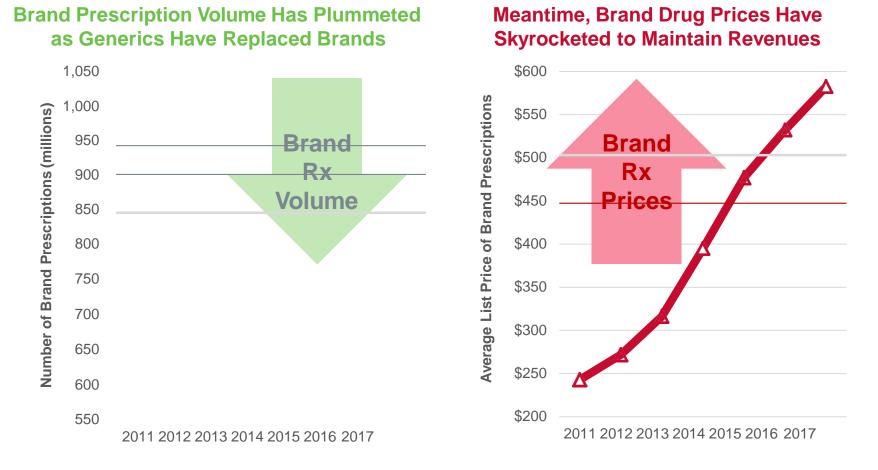

In one study, 71% of cancer patients preferred "hopeful" therapy to a sure 24 month gain

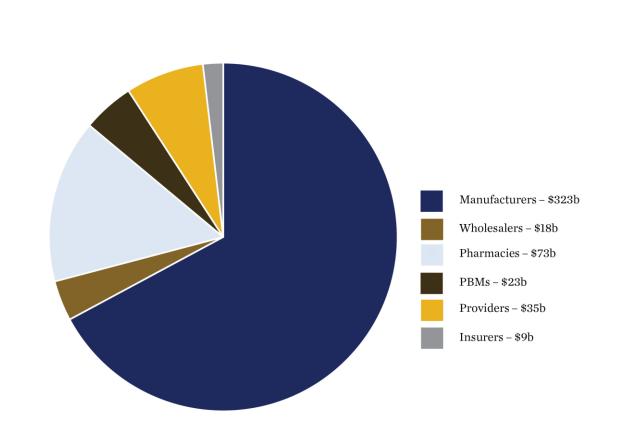

Why do Prices Increase? A Response to Shrinking Volume ?

Protected Brand Invoice and Net Price Growth %

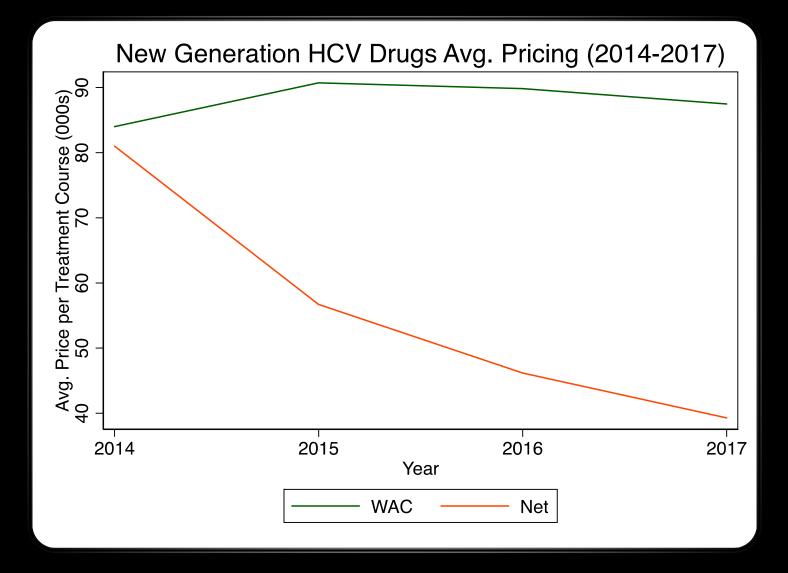

Source: IQVIA National Sales Perspectives, IQVIA Institute, Dec 2017

Chart notes: "Invoice" values are IQVIA reported values from wholesaler transactions measured at trade/invoice prices and exclude off-invoice discounts and rebates that reduce net revenue received by manufacturers. "Net" values denote company recognized revenue after discounts, rebates and other price concessions. Results are based on a comparative analysis of company reported net sales and IQVIA reported sales and prices at product level for branded products representing 75-93% of brand spending in the period displayed. All growth is calculated over same cohort of products in the prior year. See Methodology section for more details.

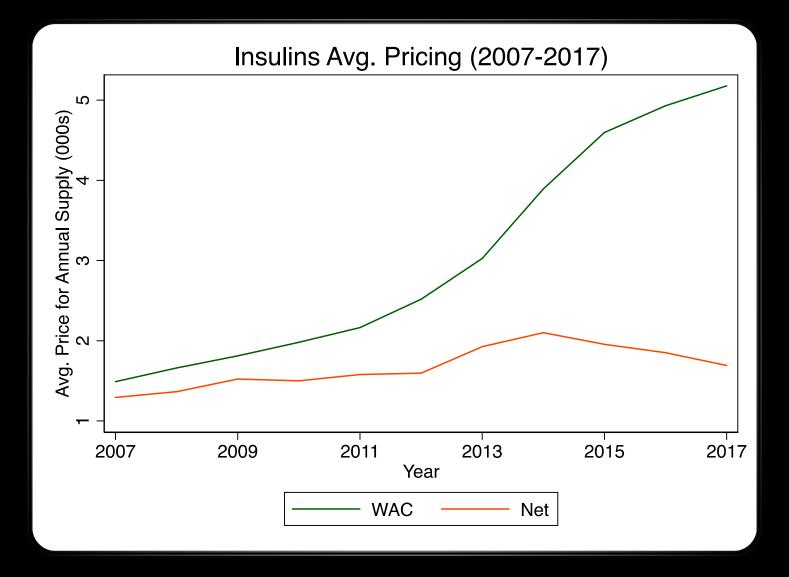

Includes all medicines in both pharmacy and institutional settings.

Report: Medicine Use and Spending in the U.S.: A Review of 2017 and Outlook to 2022, Apr 2018

Net prices for New HCV therapies decreasing despite stagnant WAC

Includes drugs in SSR database approved after Sovaldi (2013) and before 2017: Daklinza, Epclusa, Harvoni, Sovaldi, Viekira / XR, Zepatier. Drugs weighted in proportion to average number of treatment courses sold from 2014-2017; Sovaldi and Harvoni account for 80-85% of total treatment courses sold; drugs are excluded in the calendar year of launch as sales data are less reliable.

Net prices for Insulins grew more slowly than WAC

•Includes drugs in SSR database: afrezza, apidra, basaglar, humalog, humulin, lantus, levemir, novolin, novolog, soliqua, toujeao, tresiba. Product formulations were weighted in proportion to average number of treatment courses sold from 2007-2017. For formulations with missing dosing information, the mean dose from the other formulations for that product was used. Drugs are excluded in the calendar year of launch as sales data are less reliable.
