

The Economic Impact of Hurricane Katrina on its Victims:
Evidence from Individual Tax Returns

Tatyana Deryugina, Laura Kawano, and Steven Levitt

ONLINE APPENDIX

September 2014

Figures

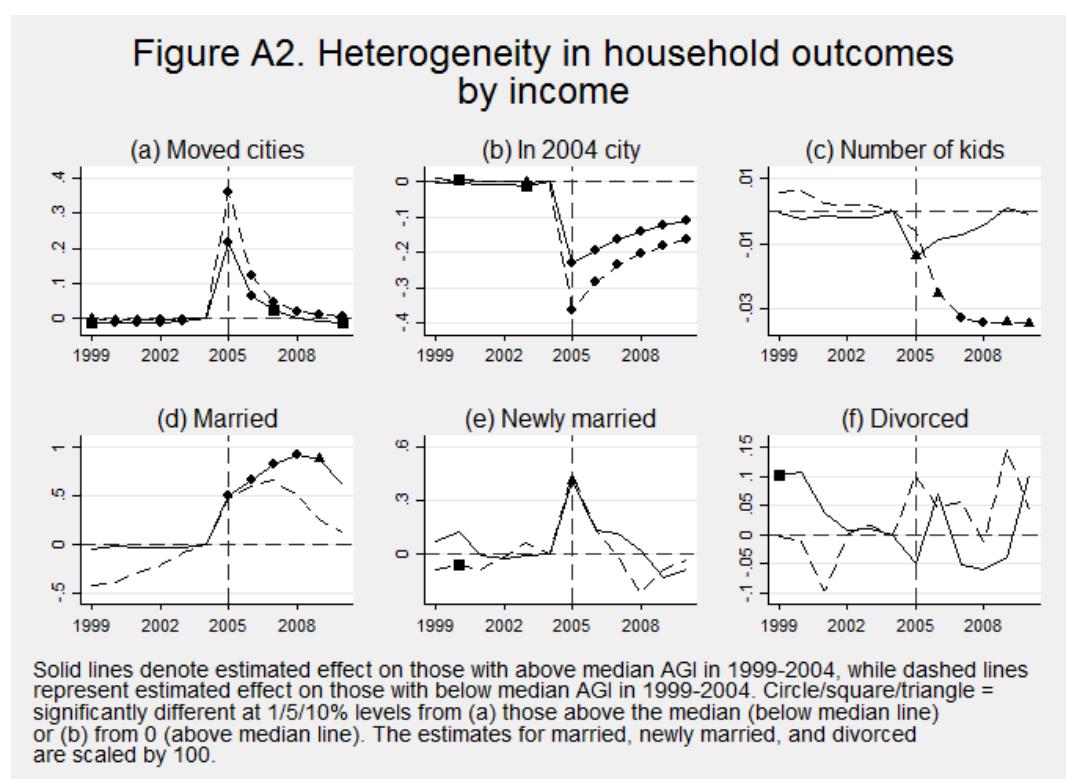

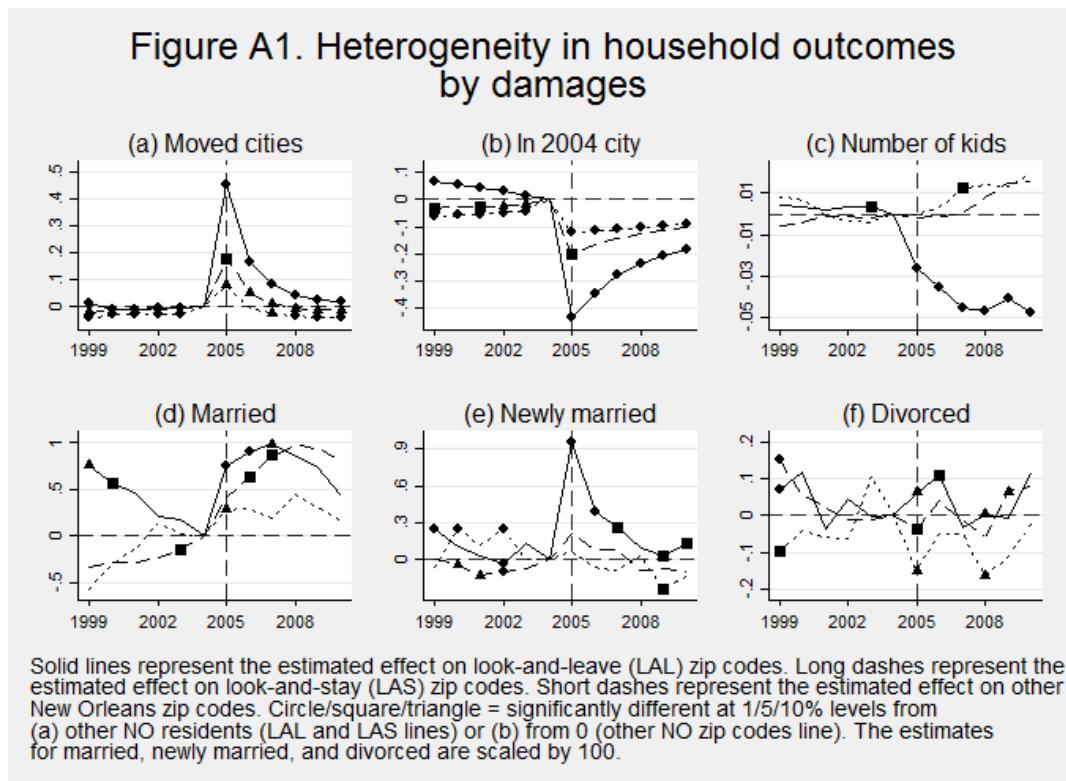

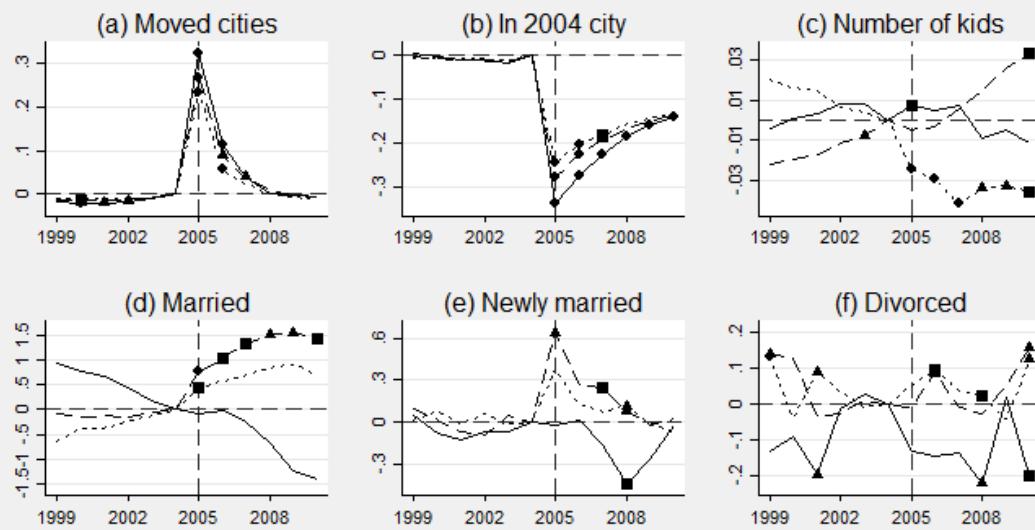

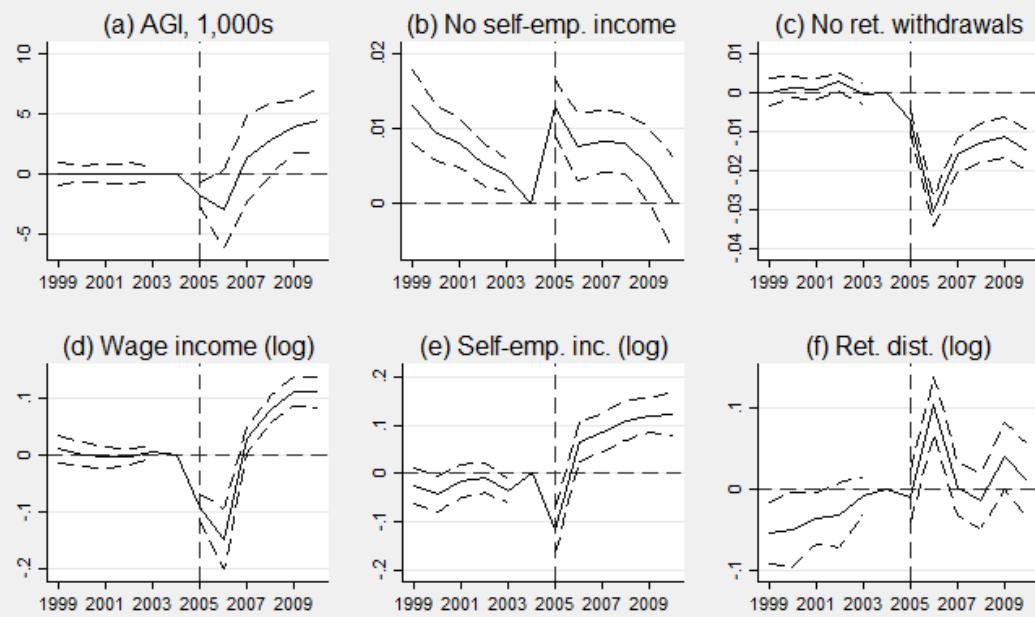

Figure A3. Heterogeneity in household outcomes by age

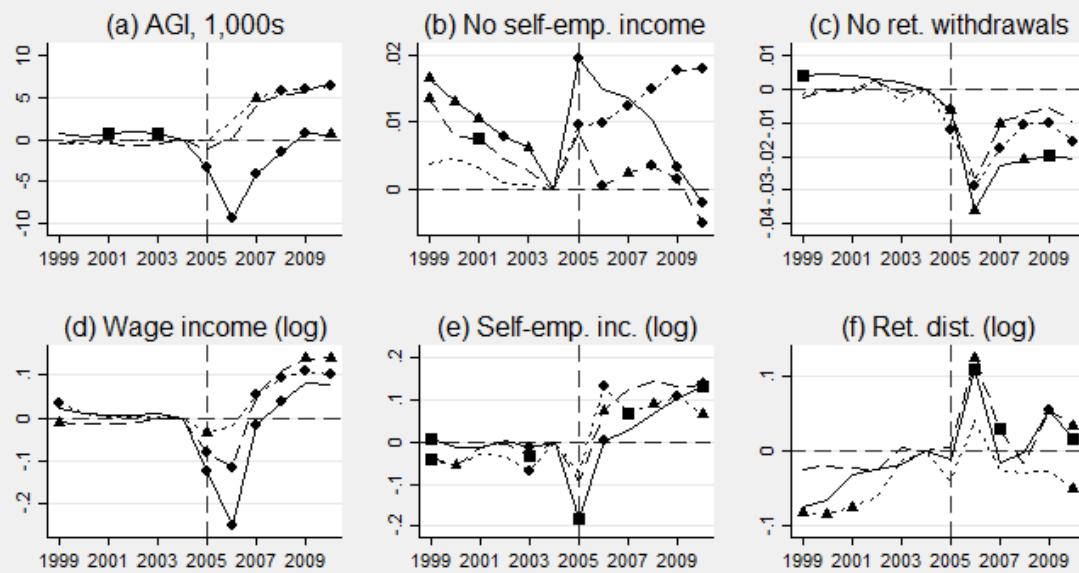

Solid lines denote estimated effect on the 30 and under age group, long dashes represent the estimated effect on 31-54 age group, while short dashes represent the estimated effect on people aged 55 and over. Circle/square/triangle = significantly different at 1/5/10% levels from (a) 30 and under (31-54 and 55+ lines) or (b) from 0 (30 and under line). The estimates for married, newly married, and divorced are scaled by 100.

Figure A4. Other effects of Hurricane Katrina, whole sample

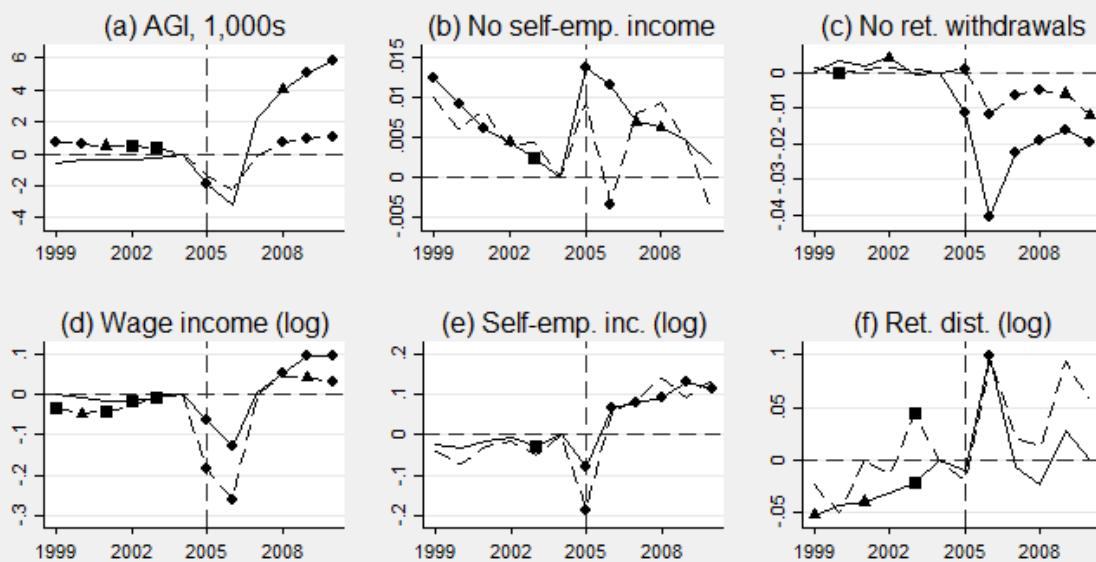

Dashed lines correspond to 95% confidence intervals.

Figure A5. Other effects of Hurricane Katrina, by LAL/LAS/other status

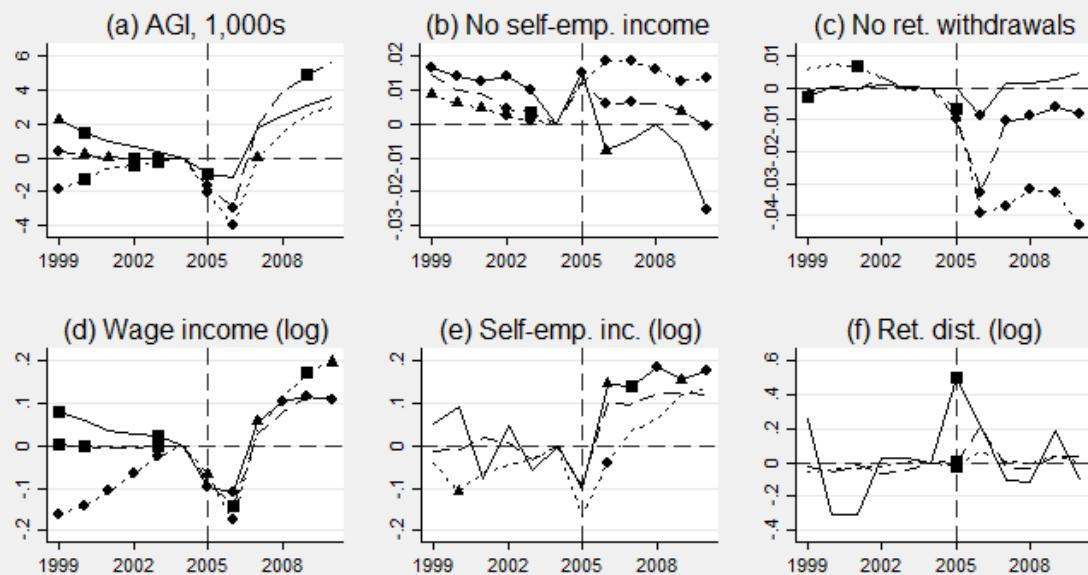

Solid lines represent the estimated effect on look-and-leave (LAL) zip codes. Long dashes represent the estimated effect on look-and-stay (LAS) zip codes. Short dashes represent the estimated effect on other New Orleans zip codes. Circle/square/triangle = significantly different at 1/5/10% levels from (a) other NO residents (LAL and LAS lines) or (b) from 0 (other NO zip codes line).

Figure A6. Other effects of Hurricane Katrina, by income

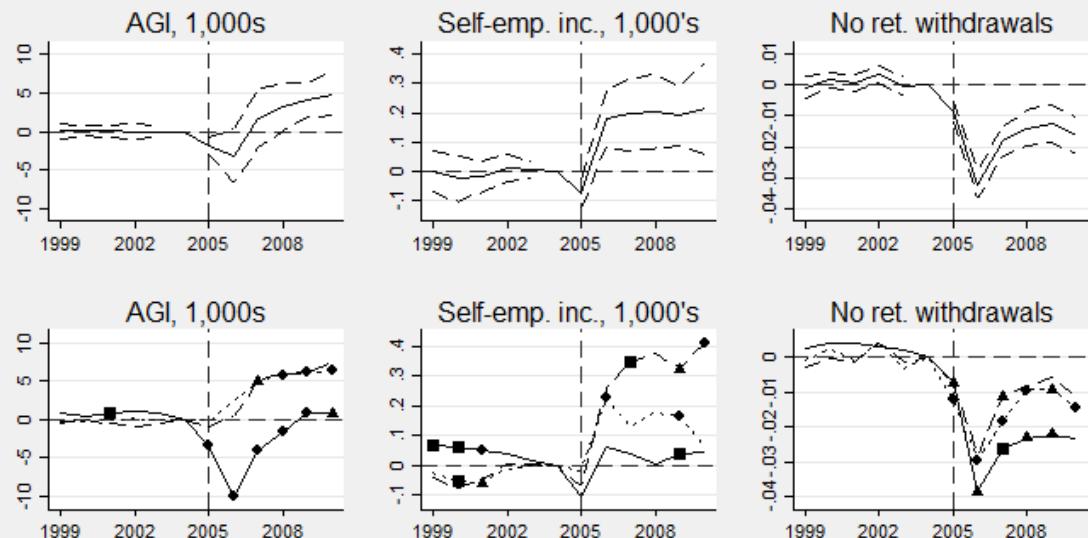

Solid lines denote estimated effect on those with above median AGI in 1999-2004, while dashed lines represent estimated effect on those with below median AGI in 1999-2004. Circle/square/triangle = significantly different at 1/5/10% levels from (a) those above the median (below median line) or (b) from 0 (above median line). The estimates for married, newly married, and divorced are scaled by 100.

Figure A7. Other effects of hurricane Katrina, by age

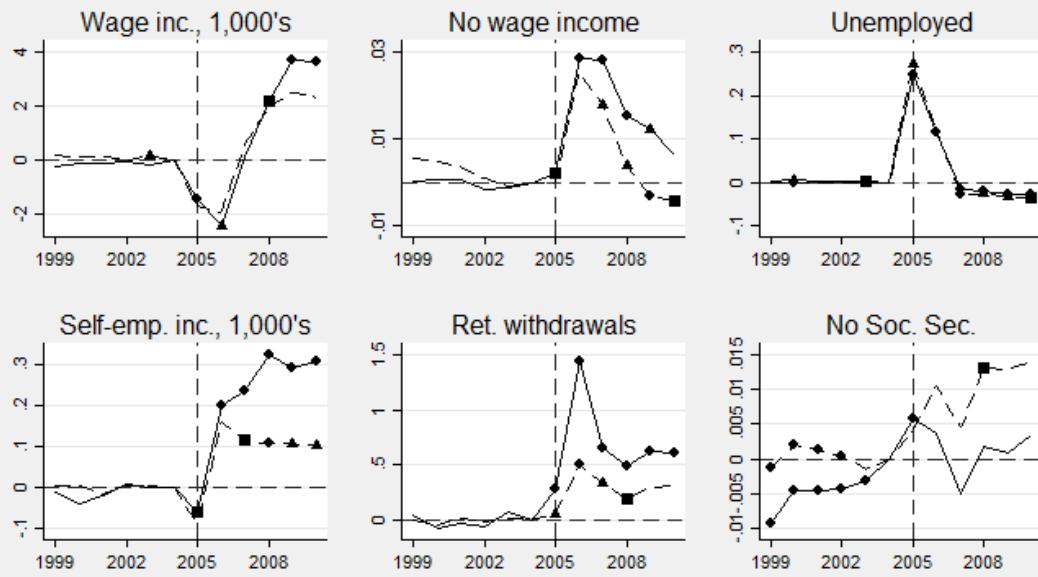

Solid lines denote estimated effect on the 30 and under age group, long dashes represent the estimated effect on 31-54 age group, while short dashes represent the estimated effect on people aged 55 and over. Circle/square/triangle = significantly different at 1/5/10% levels from (a) 30 and under (31-54 and 55+ lines) or (b) from 0 (30 and under line).

Figure A8. Effects of Hurricane Katrina in balanced sample

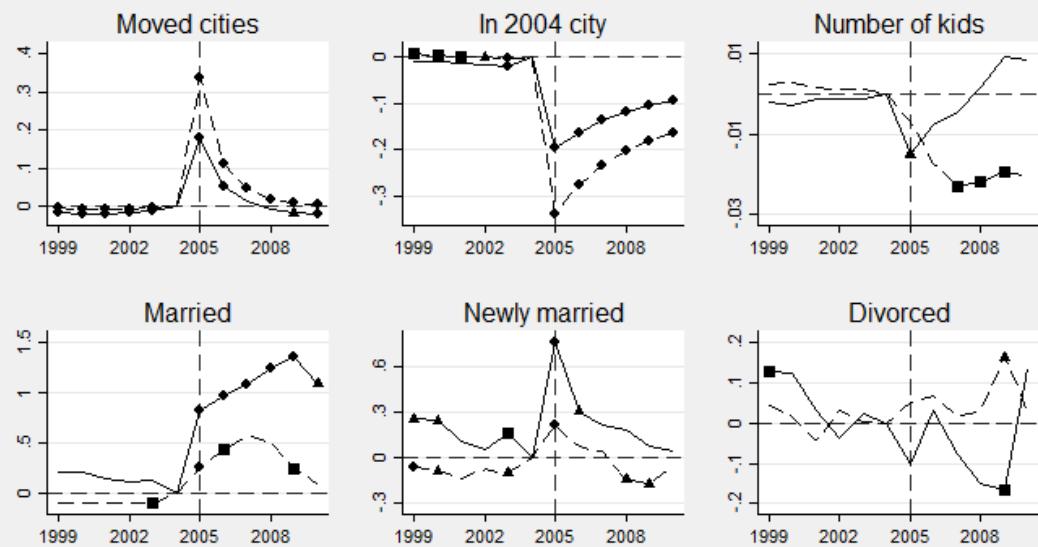

Top panel shows estimates for the whole sample. Bottom panel shows estimated effect by LAL/LAS status, with the solid line representing LAL/LAS zip codes. Dashed lines for overall sample correspond to 95% confidence intervals. Solid lines in the LAL graphs represent the estimated effect on look-and-leave (LAL) zip codes. Long dashes represent the estimated effect on look-and-stay (LAS) zip codes. Short dashes represent the estimated effect on other New Orleans zip codes. Circle/square/triangle = significantly different at 1/5/10% levels from (a) other NO residents (LAL and LAS lines) or (b) from 0 (other NO zip codes line).

Figure A9. Heterogeneity in economic outcomes by home ownership

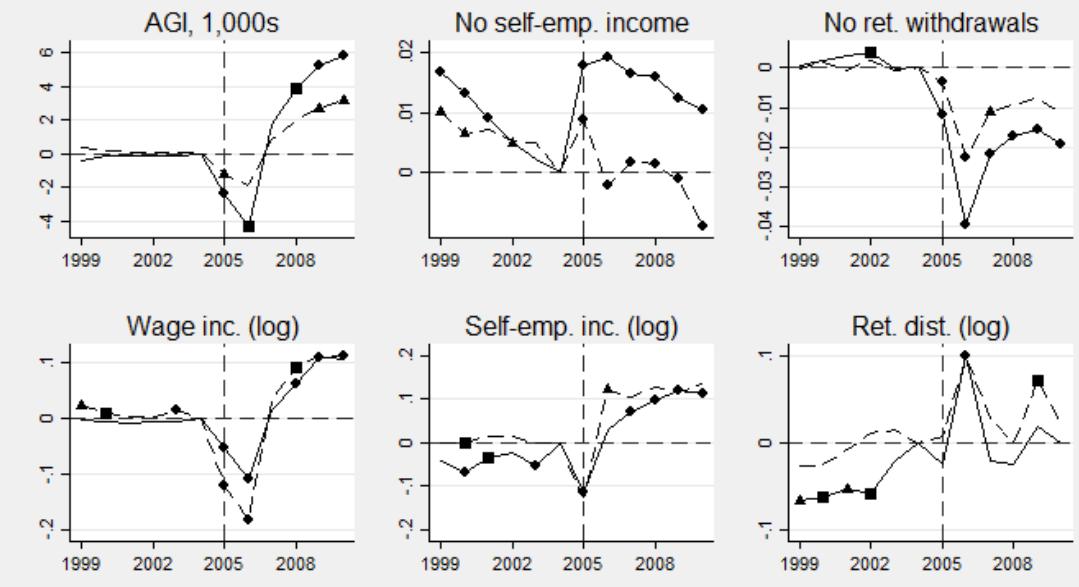

Solid lines denote estimated effect on those who owned a home in 2004, while dashed lines represent estimated effect on those who did not. Circle/square/triangle = significantly different at 1/5/10% levels from (a) those who owned homes (non-owners line) or (b) from 0 (owners line).

Figure A10. Heterogeneity in household outcomes by home ownership

Solid lines denote estimated effect on those who owned a home in 2004, while dashed lines represent estimated effect on those who did not. Circle/square/triangle = significantly different at 1/5/10% levels from (a) those who owned homes (non-owners line) or (b) from 0 (owners line). The estimates for married, newly married, and divorced are scaled by 100.

Figure A11. Other effects of Hurricane Katrina, by home ownership

Solid lines denote estimated effect on those who owned a home in 2004, while dashed lines represent estimated effect on those who did not. Circle/square/triangle = significantly different at 1/5/10% levels from (a) those who owned homes (non-owners line) or (b) from 0 (owners line).
