The Dollar as the Dominant Currency

Currency Denomination of Non-Bank Foreign Currency Debt

Source: Bank for International Settlements

- Dollar is the dominant currency: \$11.5 trillion debt outside the US.
- The fall and the rise of dollar's dominance: the GFC turning point

イロト イポト イヨト イヨト

This paper: Questions

- Why is there a dominant currency?
- Why is it the dollar?
- What explains the fall and the rise of the dollar in the last 20 years?
- Optimal monetary policy?

э

(1日) (日) (日)

This paper: Answers

- Why is there a dominant currency? Theoretical:
 - Nominal debt \rightarrow debt currency choice matters (Fisherian DD channel)
 - DC: depreciate when stock market \downarrow at corporate debt maturity (6-7y)
 - Role for monetary policy: stimulate in crises $\rightarrow \uparrow$ inflation \rightarrow FX.
- Why is it the dollar? Empirical:
 - Dollar depreciates when the stock market falls (Horizon > 1 year).
 - Micro data: Choose \$ for longer maturity debt.
- What explains the fall and the rise of the dollar in the last 20 years? Theoretical and empirical:
 - Inflation risk premia in the US and the Euro Area.
- Optimal monetary policy? Theoretical: (assigns weights to different countries)
 - Choose weights to reduce the welfare costs of higher dollar leverage.

Main Contribution: The Debt View

• Dollar's special role in the global financial system:

Goldberg and Tille (2008), Gopinath (2015), Shin (2012), Ivashina, Scharfstein and Stein (2015), Casas, Diez, Gopinath and Gourinchas (2017), Bruno and Shin (2017), Bräuning and Ivashina (2017), Maggiori, Neiman and Schreger (2018, 2019), Aldasoro, Ehlers and Eren (2018), Avdjiev, Bruno, Koch and Shin (2018)

Dominant currency (in General Equilibrium):

- vehicle currency, unit of account: Matsuyama, Kiyotaki and Matsui (1993), Rey (2001), Devereux and Shi (2013), Chahrour and Valchev (2017), Doepke and Schneider (2017), Drenik, Kirpalani and Perez (2018)
- trade view (invoicing): Gopinath and Stein (2018), Mukhin (2017)
- **safe asset view:** Farhi and Maggiori (2017), He, Krishnamurthy and Milbradt (2017), Bocola and Lorenzoni (2018)
- **debt view:** Nominal debt & Monetary policy. Does not rely on network effects, price stickiness, complementarities in pricing, safety demand.

Global debt overhang channel. Changes can be fast. Broad empirical

evidence: macro, micro, historical.

Dominant Currency Debt

◆□▶ ◆□▶ ◆目▶ ◆目▶ ●目 - のへで

The Main Mechanism

- Firms have nominal debt with face value: $B_{i,t}$.
- ▶ They receive productivity shocks *a*_{*i*,*t*}, compact support.

$$\begin{array}{c|c} \text{Low } a_{i,t} & \text{High } a_{i,t} \\ \hline \\ \hline \\ \text{Default Threshold } (B_{i,t}, a_{i,t}) & Profits(a_{i,t}) \end{array}$$

Higher inflation (\rightarrow FX depreciation), thereby CB reduces threshold.

$$\underbrace{\begin{array}{c} \text{CB}\uparrow\pi\\ \text{Low } a_{i,t}\end{array}}_{\text{Default Threshold }(B_{i,t},a_{i,t})} \text{High } a_{i,t} \\ \end{array}}_{\text{Profits}(a_{i,t})}$$

- ▶ Firms are better off $\rightarrow \downarrow$ real debt burdens. Ex-ante \uparrow leverage.
- Households?
 - Dislike inflation as it lowers their real consumption (dominates).
 - Like it because inflation lowers the default probability.

Dominant Currency Debt

International General Equilibrium

Model

- > All firms are exporters, flexible prices, cash flows fully diversified.
- Capital structure: Equity + nominal defaultable debt (potentially in multiple currencies).
- Debt overhang costs (e.g., restructuring costs after default)

Main Mechanism

- International Fisher debt-deflation channel.
- \blacktriangleright Dollar debt: inflation in the US \rightarrow FX \rightarrow Real debt burden.
- ▶ Debt service cost > operating profits → debt overhang.
- Debt overhang spills over through reduced demand + GVCs.

Central Bank

▶ Countercyclical policy rule: Output gap \rightarrow inflation \rightarrow FX.

(本語) (本語) (本語) (語)

Inflation Process and Exchange Rates

Inflation in country i:

$$\mathcal{P}_{i,t,t+1} = (OUT_GAP_{t+1}(i))^{\phi_i} e^{\varepsilon_{i,t+1}}.$$
(1)

• $OUT_GAP_{t+1}(i) = drop(\%)$ in output due to debt overhang

- $\phi_i > 0$ is the **degree of inflation stabilization** of monetary policy: High $\phi_i \rightarrow$ large positive shocks to $\mathcal{P}_{i,t,t+1}$ in bad times \rightarrow easing financial conditions for firms.
- Inflation for the model; can be thought of easing financial conditions.
- $\varepsilon_{i,t+1}$ is (small) noise in monetary policy, compact support.
- $1/\sigma_{i\varepsilon}^2$ is the **precision** of monetary policy

Exchange rates: $\mathcal{E}_{i,j,t,t+1} = \mathcal{P}_{i,t,t+1}^{-1} \mathcal{P}_{j,t,t+1}$.

• High relative inflation \rightarrow depreciation.

◆□ → ◆□ → ◆臣 → ◆臣 → ○ ● ● ● ● ●

Dominant Currency Debt Equilibrium: Assumptions

- issuing costs are independent of currency denomination. (Note: Disadvantage to the \$)
- ► TFP shocks satisfy $a_{j,t} = a_t + \varepsilon_{j,t}^a$ for some common shock a_t and idiosyncratic TFP shocks $\varepsilon_{j,t}^a$ with small variance that are independent across countries and are also independent of a_t . (Global shocks)
 - We relax this in a few slides to get local currency and dominant currency mix (works in GE when debt overhang costs are small)

(日)(同)((三)((三)((三)))

Dominant Currency Debt Equilibrium

$$\mathcal{P}_{i,t,t+1} = (OUT_GAP_{t+1}(i))^{\phi_i} e^{\varepsilon_{i,t+1}}.$$
(2)

There exists a dominant currency debt equilibrium:

- all firms borrow in a single dominant currency.
- even when there are others with almost identical characteristics.

Theorem

Suppose that ϕ_i are all pairwise different. Then, there exists a Dominant Currency Debt equilibrium. The dominant debt currency is the currency of the country with the highest index ϕ_i .

Theorem

Absent heterogeneity in the indices ϕ_i , firms always issue in the currency of the country with the highest degree of monetary policy precision, $1/\sigma_{i,\epsilon}$.

Why Issue in Dollars?

Theorem

Issuing only in dollars is optimal if and only if

Cost of issuance USD index Why not Argentine peso?

$$\frac{Cost_{i}(issue \ in \ j)}{Cost_{i}(issue \ in \ \$)} - 1 \leq e^{r_{j,t}} \frac{Cov_{t}^{\$}\left(\left(PV_{t+1}^{\$}(profits)\right)^{-\ell}, \frac{XXX(j)}{USD}\right)}{E_{t}^{\$}\left[(PV_{t+1}^{\$}(profits))^{-\ell}\right]} \quad (3)$$

for all currencies XXX(j), $j = 1, \dots, N$. Absent heterogeneity of issuance costs:

$$\operatorname{Cov}_{t}^{\$}\left(\left(PV_{t+1}^{\$}(\operatorname{profits})\right)^{-\ell}, \frac{XXX(j)}{USD}\right) \geq 0.$$
(4)

- ► Intuitive: issue in \$ if it co-moves positively with the (in USD) PV^{\$}(profits) ~ stock market.
- A period [t, t+1] is the horizon of the debt maturity of firms (6-7y).

The Last Two Decades of the Dollar and the Euro

3 🔊 3

Inflation Risk Premium

- Markets learn about the true ϕ_i through past actions of CBs
- **Conjecture:** Markets have updated $\phi_{\$}$ \uparrow for the Fed after 2008
- ▶ We can invert about these beliefs from financial asset prices:
 - Inflation Risk Premium (IRP): Covariance of inflation with investors' marginal utilities
- **Theorem:** DC = highest expected ϕ_i = highest IRP
- If true, our model predicts that the dollar share should co-move positively with IRP_{\$,t} − IRP_{€,t}

$IRP_{\notin t}^{5Y}$		-22.71***		-4.863***
0,0		(1.495)		(0.967)
Year dummy			\checkmark	\checkmark
Freq.	Q	Q	Q	Q
Observations	72	72	72	72
R-squared	0.528	0.786	0.986	0.989

Notes: Robust standard errors in parantheses. *, ***, *** denote significance at the 10, 5 and 1% level respectively. USD_t^{Shr} refers to the share of dollar debt including both bank loans and debt securities. $IRP_{5,t}^{SY}$ and $IRP_{\mathfrak{S},t}^{SY}$ refer to the 5-year inflation risk premium for the dollar and the euro as measured by Hordahl and Tristani (2014), respectively. Q and Y refer quarterly and yearly frequency since 2000.

Yen vs Pound

- Challenge for some theories: Why is JPY not dominant (low rates)?
- Japan teaches us that it is not low inflation or rates.
 - It is the inflation countercyclicality. Japan consistently undershot.
- ► GDP: Japan > UK but Debt: Yen < Pound. Inflation rates by currency
- Even Japanese firms are reducing yen issuance (Source: Nikkei)

Dominant Currency Debt

Switches Can Occur Fast: Historical Evidence

 Our model predicts switches can be fast, all depends on expectations.
 Interwar years, multiple switches between the pound and the dollar (Mehl et al (2014)). Inflation?

Eren and Malamud

Dominant Currency Debt

Optimal Monetary Policy in the DCDE

- ► Tax shields: Leverage privately optimal, but reduces social welfare.
- DC CB provides insurance to the world, ex-ante does not want to, ex-post has to.
- Optimal monetary policy: Reduces the welfare costs of providing this insurance.

Theorem

The welfare maximizing policy is to only react to output gap in countries with:

- low TFP variance, $\sigma(a_{i,t})$
- Iow restructuring cost
- Iow importance in global trade

・ロン ・回と ・ヨン・

Conclusion

- ► We provide a "debt view" for the dollar's dominance.
- International Fisherian debt-deflation in general equilibrum.
- Monetary policy and inflation countercyclicality are key.
- Dollar is dominant: it depreciates in downturns for long horizons.
- \blacktriangleright If ECB wants euro as a dominant currency $\rightarrow \uparrow \pi$ countercyclicality.
 - Cœuré (2019).
- ► New angle/questions about CBs targeting FX, currency wars.
- Dollar might lose dominance faster than we think. Expectations.
- Future work:
 - Bring in price stickiness, trade invoicing and banks.
