Theory and Lit Setting LS Strategy LS Results NHood Strategy Nhood Results Mechanisms 000 0000 000 0000 0000 0000 0000 0000 0000 0000 0000 0000 00000 00000 00000 00000 00000 00000 00000 00000 00000 00000 00000 000000

Motivation

• Governments spend billions incentivizing homeownership (US 0.5% GDP)

- Tax subsidies (primarily benefit the rich (Poterba and Sinai 2008))
- Home purchase subsidies to the poor (FHFA loans) or other non-owners (Help-to-Buy)
- Public housing privatizations (Sodini et al. 2016)

Intro

.

- Justification: private financial benefits for owners, positive externalities of homeownership for communities
- RQ: Does homeownership promote household and neighborhood success?
- Find: pos effect on household labor supply and neighborhood home prices
- Selection into homeownership makes effects difficult to identify.
 - Owners are richer, more educated, older, whiter, etc. than renters
 - Observable and unobservable characteristics of residents and the housing stock vary with homeownership (cross-section, panel)
- Limited causal evidence, esp. on external effects.

Overview of paper

• Use public housing privatization in Israel: units sold to sitting tenants

- Large changes in homeownership rates in certain locations
 - Residents and housing stock remain constant
- Variation in government-set sale price discounts for identification
 - Intertemporal (2005 increase), cross-sectional
 - Discounts affect purchases at the household level
- Measure effects of homeownership on

Setting

Intro

00

- Household labor supply behavioral change in transition
- Neighborhood quality (always-private housing prices)
- Mechanisms (besides LS):
 - School quality and young population share
 - Civic engagement (voting)
 - Renovations (wealth effect?)
 - Residential stability

- Potential externalities of ownership derive from two sources:
 - Owner-occupiers benefit from appreciation in property value
 - Owner-occupiers are more locationally stable than renters
- Incentives to boost property value (amenity capitalization) may lead to
 - Investment in physical appearance of the home and surroundings (Henderson and Ioannides 1983; Galster 1983; DiPasquale and Glaeser 1999; Harding et al. 2000)
 - Efforts to reduce crime, improve schools (PTA)
 - E.g. renovations, gardening, (guns), neighborhood watch, voting
- Greater locational stability may lead to

Theory and Lit

- More community engagement, social and civic capital, voting (DiPasquale and Glaeser 1999; Engelhardt et al. 2010; Hilber 2010; Ahlfeldt and Maennig 2015)
- Better outcomes for own and neighborhood children

(Green and White 1997; Haurin et al. 2002; Aaronson 2000; Galster et al. 2007; Gibbons et al 2017)

• Longer horizon in home reinforces property value incentives

• Inc and subst effects from subsidy (ALL such programs subsidize)

- Inc: Discounted purchase, wealthier \rightarrow work less
- Subst: Each dollar buys more house
- Households may increase their labor supply
 - To finance purchase; Sodini et al. (2016): LS effect grows with debt
 - To avoid default

Setting

Theory and Lit

000

- Asset ownership increases stake in financial health (Jha and Shayo 2019)
- Privatization context: means testing \rightarrow LS constraint
- Labor supply can directly affect neighborhood quality.
 - · Working role models; welfare to working-class shift
 - Default prevention (Campbell et al. 2011)
 - Property-tax compliance (Arbel et al. 2017)
- · Generally, many possible mechanisms of neighborhood externalities

IntroTheory and LitSettingLS StrategyLS ResultsNHood StrategyNhood ResultsMechanisms000000000000000000000000000000

Existing evidence on neighborhood externalities

- Advantage of direct approach: prices summarize local externalities (house price capitalization of local amenities)
- No estimates using a natural/real experiment or quasi-random variation.
- State-of-the-art provides bounds between neg. and large, pos. effects
 - Coulson and Li (2013): panel data with neighborhood FE
 - Residents evolve with HR over time (upward bias)
 - Housing values self-reported (likely attenuation bias)
 - Kortelainen and Saarimaa (2015): negative/no effect
 - IV: number of units per building (downward bias)
 - Corr with density, neighborhood unobservables, and externality (!)

Setting: Israeli Public Housing Privatization and the Discount Instrument

- Steady privatization at modest discounts (25%) through 1980s, 90s
- 1998 law: increase privatization; discounts rise to up to 85%

Setting

- Implemented ad hoc, new rules set each year (Arbel et al. 2014)
- Large increase in discounts implemented in 2005
- Discounts determined by government formula (region, marital status, num. children, type of rental contract, disability, **tenure in public housing**)
- Take advantage of discontinuities across plausibly exogenous margins: e.g. 2/3 children; 5/6 and 11/12 yrs tenure

LS effects for "This is My Home" buyers vs. never-buyers – four approaches: (Focus on 2005 event that increased discounts sharply.)

1. Raw averages of emp and labor income in each year

LS Strategy

2. OLS diff-in-diffs, household fixed effects

Setting

$$y_{ht} = \gamma + \pi (I_t^{post} \times I_h^{buyer}) + X_{ht} + \theta_h + \delta_t + \varepsilon_{ht}$$
(1)

 y_{ht} – employment or log labor income for household h in year t X_{ht} – time-varying household characteristics θ_h – household fixed effects δ_t – year fixed effects

$$\left(y_{ht} = \gamma + \sum_{\tau \neq 2004} \pi_{\tau} (I_{\tau} \times I_{h}^{buyer}) + X_{ht} + \theta_{h} + \delta_{t} + \varepsilon_{ht}\right)$$

Intro Theory and Lit Setting LS Strategy LS Results NHood Strategy Nhood Results Mechanisms 00 000 000 000 000 0000 0000 0000 0000 0000 0000 00000 00000 00000 00000 00000 00000 00000 00000 00000 000000 00000 000000

Strategy: Effects on New Homeowners' Labor Supply

3. IV using discounts

(Can't use non-linear model in first stage (Angrist and Pischke (2009)))

$$I_{t}^{post} \times I_{h}^{buyer} = \gamma_{1} + \pi_{1} \left(I_{t}^{post} \times \widehat{I_{h}^{buyer}}^{step0} \right) + X_{1ht} + \theta_{1h} + \delta_{1t} + \varepsilon_{1ht}$$

and the second-stage equation is:

$$y_{ht} = \gamma_2 + \pi_2 \left(I_t^{post} \times I_h^{buyer} \right) + X_{2ht} + \theta_{2h} + \delta_{2t} + \varepsilon_{2ht} \quad (2)$$

 Nearest-neighbor matching (NNM): Buyers vs. never-buyers ex-ante similar on observables. Estimate (1) with matched set FE (Ichino et al (2017)).

Several Administrative Data Sources

- Public housing records (Amidar and Amigur), 1960-2012
 - 90% of Israel's public housing units
 - Unit chars, tenants, rental rates and payments, sale details
 - Construct panel of units by detailed location, linked to tenants
- Ministry of Housing memos: sale discount rules; rent rules
- Social Security Data (NII), 2000-2012
 - Employment, labor income
 - Demographics (facilitate discount calculation)

Employment Probability Effects: Four Methods 5-7% Increase

LS Results

.

Setting

Aggregating and Estimating Neighborhood Price Effects

- Aggregate these ownership changes to neighborhood level, measure effects on quality
- ID challenge: homeownership covaries with residents and housing stock
 - Across neighborhoods in x-section, within neighborhood over time
 - Neighborhood level: residents may anticipate price appreciation
 - Ideally want to assign ownership (or subsidy) randomly to renters
- Privatization changes ownership, holding constant the residents and housing stock
 - HR changes in clusters, treating nearby always-private units
 - Measure effects on private home values, isolating externalities

IntroTheory and LitSettingLS StrategyLS ResultsNHood StrategyNhood ResultsMechanisms00000000000000000000000000000000000

Strategy: Neighborhood Price Effects

Several empirical approaches:

1. OLS, Neighborhood FE, predicting log price:

$$p_{int} = \alpha + \beta HR_{n,t-2} + \eta_n + s_{n,t-2} + Z_i + \delta_t + \varepsilon_{int}$$
(3)

 $HR_{n,t-2}$ is the *actual* public housing homeownership rate in neighborhood *n* in q t-2

Expect $\beta > 0$ if homeownership has positive externalities

- 2. IV using discounts
 - Instrument works at HH level; HR measured at neighborhood level
 - Need predicted HR by q; HH purchases not indep. across periods
 - Estimate hazard of sale and aggregate
- 3. Wtihin-town diff-in-diffs: large vs. small HR change neighborhoods

Within-Locality Diff-in-Diffs Estimates of Price Effects, "This is My Home" Sale Event (Implied 5.5% price increase per 10pp HR increase)

Figure: (a) OLS

Figure: (b) IV

Nhood Results

- Our best estimate: 1.5-2% price increase per 10pp HR increase
 - Economically meaningful relative to other neighborhood amenities:
 - School quality: 2% per 5% test score increase (Black 1999)
 - Foreclosures: -1.5-6% very close vs. close (Campbell et al. 2011)
 - Rent decontrol: 16% over ten years (Autor et al. 2014)
 - U.S. homeownership rates mostly 55-85% by geo area
- Coulson and Li (2013): 4.5% price increase per 10pp HR increase
- Eliminating endogeneity in homeownership rate changes reduces externality estimate by 1/2 to 2/3!

IntroTheory and LitSettingLS StrategyLS ResultsNHood StrategyNhood ResultsMechanisms000000000000000000000000000000000

Summary of Mechanisms Examined

- Labor supply, improved environment, working role models
 - (Exit from means testing? 1,000 NIS \uparrow income \rightarrow 2.5 NIS \uparrow rent)
- Attractiveness of neighborhood to young families with kids
 - Young population share (age 0-17) (positive)
 - School quality/ test scores (positive)
- Civic engagement and voter turnout (positive)
- Geographic stability: nah pub housing renters highly stable (4% of renters move after 5 yrs vs. 8% of buyers)
- Renovations and home care
 - Buyers renovate more, but mostly modestly and indoors
 - Effect unlikely to stem from wealth-driven upgrades

Mechanisms 000000

Discussion

• First paper to use natural expt to estimate neighborhood quality effects

- Previous neighborhood price effects likely biased, 2-3x larger
- Labor supply one possible mechanism, shift to working class (Field 2007; Sodini et al. 2016; Bergman et al. 2019)
- Results are highly policy relevant
 - Governments spend billions encouraging homeownershp
 - Low income households are the likely marginal owners: 78% homeownership above median income, 50% below (U.S. Census)
 - Hopeful findings for savings plan, mortgage assistance policies
 - Privatizations of public housing stocks can create value (gain from price appreciation more than 12x discount cost)
- Possible long-run, dynamic effects of homeownership on children
 - Importance of neighborhoods for children's outcomes (Chetty et al. 2016; Chetty and Hendren 2018; Chyn2018)
 - Homeownership may improve children's enviornments: more nearby working adults, higher overall neighborhood quality
