Disclaimer

This presentation provides results of exploratory research sponsored by the National Center for Science and Engineering Statistics (NCSES) within the National Science Foundation (NSF). This information is being shared to inform interested parties of ongoing activities and to encourage further discussion. Any views expressed are those of the authors and not necessarily those of NCSES or NSF.
Outline

• Highlights of NCSES data on postdocs
• New insights from the Early Career Doctorates Survey
• Define career in research and development, and identify influential factors
• Findings from regression analyses
• Discussions
Trends of postdoctorates - Survey of Graduate Students and Postdoctorates in Science and Engineering

Postdoctorates by Citizenship

Origin of Degree

Mechanism of Support

Source of Support

Committing to postdoc immediately after graduation - Survey of Earned Doctorates

The trend of pursuing postdoctoral positions immediately after completing doctoral training has declined for Life Sciences and Physical & Earth Sciences over time, while the trend remains stable at much lower rates, below overall average, for other fields. In recent years, about 30% of graduates indicated committing to postdoc or further training immediately after completing their doctorates.

New insights from the Early Career Doctorates Survey

Target Population
• Individuals who earned their first doctorate or equivalent degree in the last 10 years
  • Postdocs
  • Faculty
  • Nonfaculty researchers
  • Administrators
• Working at:
  • U.S. academic institutions (doctorate and master’s granting)
  • Federally funded research and development centers
  • National Institutes of Health Intramural Research Programs

Questionnaire Contents
• Educational history
• Professional activities
• Employment
• Work and personal life
• Career development and plans
• Demographics
Early career doctorates in academia – moving out of postdoc and up the ladder during the first 10 years

Among early career doctorates working at academic institutions during the week of October 1st, 2017, 70% were in faculty positions while 19% were postdocs and 11% in all other positions. Tenured faculty and tenure-track faculty accounted for 48%.

Early career doctorates were more likely to hold postdoc positions the closer they were to their doctorate award year. Almost 83% of postdocs earned their doctorate between 2013-2017 while 93% of tenured faculty earned their doctorate between 2007 – 2012.

Career advisors and mentors of early career doctorates

Early career doctorates with a mentor or individuals who they considered to be their mentors

Have a mentor
- Postdoc: 40%
- Supervisor: 30%
- Senior colleague: 20%
- Peer or colleague: 10%
- Doctoral degree advisor: 0%

Have career advisor
- Postdoc: 100%
- Other faculty: 90%
- On tenure track: 80%

Primary career advisors of early career doctorates
- Postdoc: Supervisor (10%), Senior colleague (0%), Peer or colleague (0%), Doctoral degree advisor (0%), Someone else (90%)
- Other faculty: Supervisor (10%), Senior colleague (0%), Peer or colleague (0%), Doctoral degree advisor (0%), Someone else (90%)
- On tenure track: Supervisor (10%), Senior colleague (0%), Peer or colleague (0%), Doctoral degree advisor (0%), Someone else (90%)

Work-life balance and job satisfaction of early career doctorates covering 2013 to 2017 doctorate award years

Able to manage demands of position

Disagree  Neither agree nor disagree  Agree

Work schedule allowed maintenance of desired quality of life

Disagree  Neither agree nor disagree  Agree

Supervisor understood relationship between personal and professional responsibilities

Disagree  Neither agree nor disagree  Agree

Demands at home have slowed progress of professional activities

Disagree  Neither agree nor disagree  Agree

Satisfaction with job held in 2017

Disagree  Neither satisfied nor dissatisfied  Satisfied

83% of postdocs interested in pursuing research track at the time of earning their doctorate

Overall, 31.5% reported changing career track between the time of earning their doctorate and 2017. Interests, strengths, and skills is the leading reason for pursuing career track.

Defining a career in research and development (R&D)

NCSES education survey: Survey of Earned Doctorates (SED) offers an early indicator of pursuing career in R&D

- Commitment to postdoc after graduation; primary work activity will be in R&D

NCSES workforce surveys: Survey of Doctorate Recipients (SDR) offers multiple job characteristics for defining career in R&D

- Primary work activities on principal job (basic research, applied research, development, design of equipment, processes, structure, models)
- Employment sector (academia vs. other sectors)
- Tenure status and faculty rank
- Work supported by contracts or grants from Federal government
- The extent to which the job is related to doctoral field of study

Recently developed SDR-WoS linked data offer longitudinal data on scientific publication output, simplifying tracking career development in R&D
Employment commitment immediately post-graduation as an early indicator is associated with propensity of performing R&D in future jobs. For the graduating cohort (AY 2011-2013), among those who started out in postdoc, 69% are working in R&D jobs (defined by reported primary work activities) in 2019, and 52% reported holding R&D jobs continuously from 2015 – 2019.

Identify factors influencing future research propensity

• Background and demographics
  - Sex, Race/Ethnicity, Citizenship, Marital status, Parental education, Live with young children, undergraduate institution type

• Graduate training and support
  - Source of graduate support, Graduate debt, Carnegie classification of Doctorate institution, doctorate field of study, Pre-doctorate publications

• Early indicators (self-reported post-graduation plan)

• Scientific publication output
  - Characteristics of publication produced 1-5 years post-PhD, publication produced 6-10 years post-PhD
Top factors influencing propensity to perform R&D

Logistic regression is used to examine the role of various factors in influencing career path choices in R&D (indicated by a dichotomous indicator of working activities are primarily R&D). The cohort, AY 2006-2008, is used to examine outcomes at 12 years post-PhD, and the cohort, AY 2011-2013 for outcome at 7 years post-PhD using the SDR 2019 for outcome measures.

The indicators of having at least one publication and having at least one non-US coauthor are among the top factors. When publication indicators from more recent period are included in the model, earlier indicators become less influential.
Those who started out with definite commitment in academia

Postdoctoral experience is a strong and positive factor for staying on R&D performing jobs. However, among PhDs with definite commitment in academia, those who started out in non-postdoc positions performed better in terms of holding on a job in academia or obtaining tenure or tenure-track.

- Postdoc
  - At graduation
  - 5 years later

- Non-postdoc employment
  - At graduation
  - 5 years later

Importance of skills to current position

Discussion

- Research on factors that are associated with the transitioning to postdoc positions and from postdoc to R&D jobs is beginning to emerge
- The rich source of data for US postdocs are NCSES surveys
- Literature suggests demographic factors, publication history (success), and postdoc experience influence transition to R&D positions
- We explore the relationship of publication history and demographic characteristics with the likelihood of postdocs transitioning to R&D positions
