# Political Preferences and the Spatial Distribution of Infrastructure: Evidence from California's High-Speed Rail 

Pablo Fajgelbaum ${ }^{\ddagger}$, Cécile Gaubert ${ }^{\dagger}$, Nicole Gorton, Eduardo Morales* and Edouard Schaal ${ }^{\S}$<br>${ }^{\ddagger}$ UCLA, ${ }^{\dagger}$ UC Berkeley, *Princeton, ${ }^{\S}$ CREI

July 2023

## Motivation and Research Question

- Transportation infrastructure projects are often massive public investments
- Controversial, create winners and losers
- Many considerations besides the purely economic enter in preferences:
- People: party line, preferences for public good, environmental concerns ("Political preferences")
- Policy makers: may favor some constituents over others

1. How important are economic vs political components in policy preferences for transport infrastructure?
2. How do these preferences, together with distributional concerns, shape infrastructure projects?

## Setting: the California High Speed Rail (CHSR)

- Electric high-speed train connecting urban centers in CA
- Among most expensive projects in US history
- We observe voting across 8 k census tracts
- Proposition 1a put on the ballot in 2008
- Issue bonds for $\$ 10$ bn ( $0.4 \%$ CA GDP)
- Total cost $>\$ 40$ bn; first segment in 2022
- $\geq 200 \mathrm{mph}$ (SF-LA: 2:40')
- 24 stations over 800 miles
- Construction began in 2015, many hurdles
- Central Valley segment ( 170 miles) by 2030
- Current Phase-I cost projection: $>130 \mathrm{~b}$

## HSR Planned Route and \% Yes on Prop 1a

## This Paper

1. Estimate weight of real income vs political component in preferences for CHSR

- Develop and estimate model to compute expected income gains
- Voters were responsive to economic impacts, but swaying votes is costly
- $0.2 \%-0.4 \%$ gains to increase support by 1 percentage point
- Political component (e.g. party affiliation) drives 5X more spatial variation in votes than income
- CHSR would have been approved without preferences for real income

2. Estimate social planner preferences over demographic groups and votes

- Revealed preferences: deviations from observed HSR design define bounds on utility parameters
- Strong planner's preference for popular approval
- Apolitical planner would have optimally placed stations nearer denser areas
- 50\% larger utilitarian gains than actual CHSR design

## Literature Review

- Real income effects of infrastructure (summary Redding and Turner 15 )
- Donaldson 12, Faber 14, Donaldson and Hornbeck 16,...
- Rails: Gupta et al. 21, Severen 21, Bernard et al. 19, Borusyak and Hull 21, Dong et al. 20,...
- Quantitative spatial models (summ Redding and Rossi-Hansberg 17) dive into:
- Commuting: Ahlfeldt et al. 15, Monte et al. 18, Dingel and Tintelnot 21,...
- Distributional effects: Tsivanidis 19, Balboni et al. 20, Barwick et al. $21, \ldots$
- Optimal Infrastructure Design: Alder 19, Fajgelbaum and Schaal 20, Allen and Arkolakis 21
- Individual's policy preferences and referenda
- Deacon and Shapiro $75, \ldots$, Kahn and Matsusaka 97, Gerber and Lewis 04, Wu and Cutter 11, Kendall and Matsusaka 21
- HSR: Holian and Kahn 13,15
- Trade: Hicks et al 14, Becker et al 17, Mendez and Van Patten 22
- Estimation of planner's preferences
- PF: Christiensen 81, Bourguignon and Spadaro 12, Jacobs et al. 17, Hendren 20
- Trade: Goldberg Maggi 99,...
- Political Economy of Transportation
- Brueckner and Selod 06, Glaeser and Ponzetto 18
- Burguess et al. 15, Alder and Kondo 20

## Utility and Voting

- Utility gain to a voter $\omega$ in census tract $i$ if Prop1a passes:

$$
\Delta u_{\omega}=\hat{W}(i)+\sum_{k=1}^{K} \tilde{\beta}_{k} X_{k}(i)+\varepsilon_{\omega}(i)
$$

- $\hat{W}(i)$ : expected annualized gain if Prop1a is approved
- $X_{k}(i)$ : proxies for political preferences (affiliated democrat, votes in other propositions)
- Assume $\varepsilon_{\omega}(s) \sim E V\left(\theta_{V}\right)$. Fraction of favorable votes:

$$
\ln \left(\frac{v(i)}{1-v(i)}\right)=\theta_{v} \hat{W}(i)+\theta_{v} \sum_{k} \tilde{\beta}_{k} X_{k}(i)+\epsilon(i)
$$

- $v(i): \%$ vote in favor of CHSR
- $\epsilon(i)$ : unobserved determinants of the vote

## Model of Economic Gains

- Develop spatial framework in style of Ahlfehldt et al 15 with CHSR-specific features
- Residents commute and consume a traded good, housing, and \# leisure trips
- Firms produce using land, labor, and \# business trips
- For each travel purpose, choose destination and transport mode (McFadden 74)
- \{car, public transit (+CHSR), airplane (+CHSR), walk/bike \}
- money and time costs for each route and mode
- (+Land prices and wages, agglomeration and congestion spillovers)
- Incorporate risk of non-completion and assume voter is uncertain about future travel
- Entertain range of assumptions on HSR costs and GE forces

Real Income Measurement in Baseline: Time+Cost Shocks Only Real income change in tract $i$ conditional on CHSR completion:

$$
\hat{V}(i)=\underbrace{\left(\sum_{j} \sum_{m} \lambda_{i, j, m}^{C}\left(\hat{l}_{i, j, m} \hat{\tau}_{i, j, m}^{-\rho}\right)^{\theta_{C}}\right)^{\frac{1}{\theta_{C}}}}_{\text {Faster/Cheaper Commute }} \underbrace{\left(\sum_{j} \sum_{m} \lambda_{i, j, m}^{L}\left(\frac{\hat{\tau}_{i, j, m}^{-\rho}}{\hat{t}_{i, j, m}}\right)^{-\theta_{L} \mu_{L}}\right)^{\frac{1}{\theta_{L}}}}_{\text {Faster/Cheaper Leisure Travel }}
$$

- $\lambda_{i, j, m}^{C}, \lambda_{i, j, m}^{L}$ : pre-CHSR commuting and leisure-travel shares
- $\hat{l}_{i, j, m}$ : change in disposable income due to CHSR tax or commuting cost
- $\hat{\tau}_{i, j, m}$ and $\hat{t}_{i, j, m}$ : time and cost savings on best route
- $\theta_{k}$ : substitution across destinations for $k=\{$ commuting, leisure, business $\}$
- $\rho$ : conversion from travel time to income
- $\mu_{k}$ : weights of $k=\{$ leisure, business $\}$ in personal and business expenditures

## Time Elasticities from Travel Decisions

- Commuting (ACS, 2006-2010):

$$
\ln \lambda_{i, j, m}^{C}=\nu_{i, m}^{C}+\theta_{C} \ln \left(w_{i, j}-t_{i, j, m}^{C}\right)-\theta_{C} \rho \ln \tau_{i, j, m}+\varepsilon_{i, j, m}^{C}
$$

- Yields: $\theta_{C} \rho=2.22^{* * *}, \theta_{C}=2.97^{* * *} \rightarrow \rho=0.75^{* * *}$
- In line with Monte et al. 18, Severen 19
- Younger, more white, college-educated tracts have stronger preference for car
- Leisure and Business Trips (CAHTS, 2012):

$$
\ln \left(\# T R I P S_{i, j, m}^{k}\right)=\nu_{i, m}^{k}+q_{i, j}^{k}-\theta_{k} \mu_{k} \rho \ln \tau_{i, j, m}-\left(1+\theta_{k} \mu_{k}\right) \ln t_{i, j, m}^{k}+\varepsilon_{i, j, m}^{k}
$$

for $k \in\{$ leisure, business $\}$

- $\mu_{L} \theta_{L} \rho=1.20^{* * *}$. With $\mu_{L}=5.0 \%$ (BLS) $\rightarrow \theta_{L}=31.99^{* * *}$
- $\mu_{B} \theta_{B} \rho=1.65^{* * *}$. With $\mu_{B}=1.5 \%$ (GBTA) $\rightarrow \theta_{B}=146.98^{* * *}$
- Relatively stronger preference for car (air) among leisure (business) travelers

## HSR Shock

|  | \% Initial Travelers <br> Directly Better Off |  | Time Gain <br> (among CHSR users) | Cost Change (Pub. Trans. or Air) <br> 2008 CHSR Price |  | 2X Ticket Price |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Real Income Effects

Figure: \% Economic Gains

| Case | Annual Gain | 2008 USD | Leisure+ |
| :--- | :---: | :---: | :---: |
|  |  | per worker | Business |
| Baseline | $0.32 \%$ | $\$ 143.0$ | $0.03 \%$ |
| Full Model | $0.65 \%$ | $\$ 292.4$ | $0.41 \%$ |
| Pessimistic | $-0.18 \%$ | $\$-81.9$ | $-0.04 \%$ |
| + Car | $0.60 \%$ | $\$ 265.6$ | $0.15 \%$ |

- Baseline: top $10 \%$ tracts gain $0.6 \%$ to $4.7 \%$
- bottom $2.7 \%$ lose
- Winning tracts: closer to stations, use public transit more, longer commutes

- LA and SF: higher gains
- Fresno, Bakersfield: lower gains

## Voting Equation

$$
\ln \left(\frac{v(i)}{1-v(i)}\right)=\theta_{V} \ln \hat{W}_{19}(i)+\underbrace{\sum_{k=1}^{K} \beta_{k} X_{k}(i)}_{\theta_{V} \ln \hat{a}(i)}+\epsilon(i)
$$

- Proxies $X_{k}(i)$ for political preferences:
- \% of registered Democrats and
- shares of votes in 2008 Prop 10 (Alternative Fuels) and 2006 Prop 1B (Transportation Bond)
- Identification issues
- $\epsilon(i)$ includes expectational error
- Placement correlated with unobserved political values
- Model misspecification
- Instrument for $\hat{W}_{19}$ using randomly placed stations along feasible routes, at 2008 fundamentals - alt routes
- Use different models and different restrictions on the sample

## Voting Equation

| Inst. Var.: | None - OLS |  |  |  | $\ln \left(\hat{W}_{08}\right)$ | Random Station (6) | Random Path (7) |

| Log. Dist. Rail |  |  |  | $0.02{ }^{\text {a }}$ | $0.02^{\text {a }}$ | $0.01{ }^{\text {a }}$ | $0.01{ }^{\text {a }}$ |
|  |  |  |  | (0.00) | (0.00) | (0.00) | (0.00) |
| F-statNum. Obs. |  |  |  |  | 803 | 574 | 286 |
|  | 7861 | 7861 | 7861 | 7861 | 7861 | 7861 | 7861 |

Note: ${ }^{a}$ denotes $1 \%$ significance level. Robust standard errors in parenthesis. All specifications control for county fixed effects.

## Cost to Sway 1\% of Vote

|  | $\theta_{V}$ | At Median Tract | 90 p |
| :--- | :---: | :---: | :---: |
| Baseline | 19.5 | $0.4 \%$ | $0.5 \%$ |
| Full Model | 17.5 | $0.4 \%$ | $0.6 \%$ |
| Pessimistic | 41.6 | $0.2 \%$ | $0.3 \%$ |
| + Car | 19.2 | $0.4 \%$ | $0.6 \%$ |

Note: table reports $\theta_{V}$ and percentiles of $\frac{1}{\theta_{V^{v(i)^{2}}(1-v(i))}} \%$
$\rightarrow$ Quite Costly to change votes

## Real Income vs Political Component in Preferences

$$
\mathbb{E}\left[\Delta u_{\omega}(i)\right]=\ln \hat{a}(i)+\hat{W}(i)
$$

|  | $\sigma_{\Delta \ln a}$ | $\sigma_{\Delta \ln \hat{W}}$ |
| :--- | :---: | :---: |
| Baseline | $2.2 \%$ | $0.4 \%$ |
| Full Model | $2.4 \%$ | $0.4 \%$ |
| Pessimistic | $1.0 \%$ | $0.2 \%$ |
| + Car | $2.3 \%$ | $0.6 \%$ |

Note: In $\hat{a}(i)$ includes all variables and constants
$\rightarrow$ Political component drives much larger fraction of spatial variation in preferences and votes

## Real Income vs Political Component in Aggregate Vote

$$
v(i)=\frac{\hat{W}(i)^{\theta} V \hat{a}(i) \exp \epsilon(i)}{1+\hat{W}(i)^{\theta} V \hat{a}(i) \exp \epsilon(i)}
$$

|  | Aggregate Vote |  | Loss for |
| :--- | :---: | :---: | :---: |
|  | $\hat{W}$ only | â only | $50 \%$ vote |
| Baseline | $51.4 \%$ | $51.6 \%$ | $0.3 \%$ |
| Full Model | $52.7 \%$ | $50.3 \%$ | $0.1 \%$ |
| Pessimistic | $47.9 \%$ | $54.9 \%$ | $0.5 \%$ |
| + Car | $52.7 \%$ | $50.4 \%$ | $0.1 \%$ |

Note: actual vote was $52.6 \%$
$\rightarrow \mathrm{HSR}$ would have passed with uniform real income losses of $0.3 \%$ to $0.5 \%$

## Economic and Political Drivers of CHSR Design

- Posit social welfare function:

$$
\mathcal{W}=\max _{\mathbf{d} \in D} \mathbb{E}\left[\sum_{i} N(i) \Omega(i) \ln \hat{W}(i ; \mathbf{d})+\lambda \sum_{i} N(i) v(i ; \mathbf{d})\right]
$$

- $\mathbf{d} \equiv\left(d_{1}, . ., d_{24}\right)$ are coordinates of 24 stations
- Pareto weights $\Omega(i)$ a function of \{Density, Wage, Share College, Share Non-White\}
- Alternative designs must yield welfare loss:

$$
\Delta \mathcal{W} \approx \underbrace{\sum_{i} \Omega(i) N(i) \Delta \ln \hat{W}(i)}_{\text {Utilitarian Welfare Change }}+\lambda \underbrace{\sum_{i} \theta_{v} v(i)(1-v(i)) N(i) \Delta \ln \hat{W}(i)-\epsilon \leq 0}_{\text {Votes Change }}
$$

- Deviations that increase votes and reduce utilitarian component $\rightarrow$ Upper bound on $\lambda$
- Decrease votes and increase utilitarian component $\rightarrow$ Lower bound on $\lambda$
- Compute confidence set using modified method of moments (Andrews and Soares, 2010)

## Example of Perturbation

Perturbation that reduces aggregate welfare but increases votes:

$\Rightarrow$ Not picked by the planner, hence $\lambda$ cannot be too high

## Identification of Preference for Votes

Utilitarian Welfare Change $+\lambda$ Votes Change $\leq 0$

Estimate: $\lambda \in[0.46,2.3]$ without covariates; $\lambda \in[0.61,1.68]$ with all covariates table

## Apolitical Planner $(\lambda=0)$ : Optimal Station Distribution

- Utilitarian welfare change:
- Aggregate: 0.18\% (baseline: 0.32\%)
- Across tracts: [-1.70\%, 4.25\%]
- Vote change:
- Aggregate: - $0.18 \%$
- Across tracts: $[-14.15 \%, 3.79 \%$ ]
- Top quartile of density gains: $0.46 \%$
- Bottom quartile of vote elasticity: 0.39\%
- Apolitical planner moves stations closer to dense democratic areas

Apolitical Planner $(\lambda=0)$ : Reallocations towards L.A.

Welfare

Voting Gradient

## Conclusion

- How important are political considerations for transport infrastructure policy?
- We gain insights into individual and planner preferences from the CHSR
- Individuals:
- Economic gains do matter for policy preferences, but swaying votes is costly
- Political considerations dominate spatial variation in policy preferences
- CHSR would have been approved even without promised income gains
- Planner:
- Strong preference for approval
- Apolitical planner would have placed stations closer to urban centers

## Travel Choices

Resident of census tract $i$ :

$$
\max _{\left(j_{C}, m_{C}, R_{i, j_{C}, m_{C}}^{C}\right),\left(j_{L}, m_{L}, R_{i, j_{L}, m_{L}}^{L}\right)} \frac{B_{i}}{r_{i}^{\mu_{H}}}\left(\frac{y_{i, j_{C}}-t_{C}\left(R_{i, j_{c}, m_{C}}^{C}\right)}{d\left(R_{i, j_{c}, m_{C}}^{C}\right)} \varepsilon_{j_{C}, m_{C}}^{C}\right)\left(\frac{B_{j_{L}}}{t_{L}\left(R_{i, j_{L}, m_{L}}^{L}\right) d\left(R_{i, j_{L}, m_{L}}^{L}\right)}\right)^{\mu_{L}} \varepsilon_{j, m_{L}}^{L}
$$

- Chooses destination, mode, and route for commuting and leisure

## Travel Choices

Resident of census tract $i$ :

$$
\max _{\left(j_{c}, m_{C}, R_{i, j_{C}, m_{C}}^{c}\right),\left(j_{L}, m_{L}, R_{i, j_{L}, m_{L}}^{L}\right)} \frac{B_{i}}{r_{i}^{\mu_{H}}}\left(\frac{y_{i, j_{C}}-t_{C}\left(R_{i, j_{C}, m_{C}}^{C}\right)}{d\left(R_{i, j_{C}, m_{C}}^{C}\right)} \varepsilon_{j_{c}, m_{C}}^{C}\right)\left(\frac{B_{j_{L}}}{t_{L}\left(R_{i, j_{L}, m_{L}}^{L}\right) d\left(R_{i, j_{L}, m_{L}}^{L}\right)}\right)^{\mu_{L}} \varepsilon_{j, m_{L}}^{L}
$$

- Consumes residential amenities and pays for housing

## Travel Choices

Resident of census tract $i$ :

$$
\max _{\left(j_{c}, m_{C}, R_{i, j_{C}, m_{C}}^{c}\right),\left(j_{L}, m_{L}, R_{i, j_{L}, m_{L}}^{L}\right)} \frac{B_{i}}{r_{i}^{\mu_{H}}}\left(\frac{y_{i, j_{C}}-t_{C}\left(R_{i, j_{c}, m_{C}}^{C}\right)}{d\left(R_{i, j_{C}, m_{C}}^{C}\right)} \varepsilon_{j_{C}, m_{C}}^{C}\right)\left(\frac{B_{j L}}{t_{L}\left(R_{i, j_{L}, m_{L}}^{L}\right) d\left(R_{i, j_{L}, m_{L}}^{L}\right)}\right)^{\mu_{L}} \varepsilon_{j, m_{L}}^{L}
$$

- Spends income, net of monetary and utility cost of commuting, with $\varepsilon_{j c, m_{C}}^{C} \sim E V\left(\theta_{C}\right)$
- Disutility from time:

$$
d\left(R_{i, j, m}\right)=D_{i, m} \tau\left(R_{i, j, m}\right)^{\rho}
$$

## Travel Choices

Resident of census tract $i$ :

$$
\max _{\left(j_{C}, m_{C}, R_{i, j_{C}, m_{C}}^{C}\right),\left(j_{L}, m_{L}, R_{i, j_{L}, m_{L}}^{L}\right)} \frac{B_{i}}{r_{i}^{\mu_{H}}}\left(\frac{y_{i, j_{C}}-t_{C}\left(R_{i, j_{c}, m_{C}}^{C}\right)}{d\left(R_{i, j_{C}, m_{C}}^{C}\right)} \varepsilon_{j_{c}, m_{C}}^{C}\right)\left(\frac{B_{j_{L}}}{t_{L}\left(R_{i, j_{L}, m_{L}}^{L}\right) d\left(R_{i, j_{L}, m_{L}}^{L}\right)}\right)^{\mu_{L}} \varepsilon_{j, m_{L}}^{L}
$$

- Consumes leisure trips, net of monetary and utility costs of travel, with $\varepsilon_{j, m_{L}}^{L} \sim E V\left(\theta_{L}\right)$
- Disutility from time:

$$
d\left(R_{i, j, m}\right)=D_{i, m} \tau\left(R_{i, j, m}\right)^{\rho}
$$

## Real Income Measurement: Time+Cost Shocks+GE

- Real income change in tract $i$ :

$$
\begin{aligned}
& \hat{V}(i)=\underbrace{\left(\sum_{j} \sum_{m} \lambda_{i, j, m}^{C}\left(\hat{r}_{i}^{-\mu_{H}} \hat{B}_{i} \hat{l}_{i, j, m} \hat{\tau}_{i, j, m}^{-\rho}\right)^{\theta_{C}}\right)^{\frac{1}{\theta_{C}}}} \underbrace{\left(\sum_{j} \sum_{m} \lambda_{i, j, m}^{L}\left(\hat{B}_{j} \frac{\hat{\tau}_{i, j, m}^{-\rho}}{\hat{t}_{i, j, m}}\right)^{-\theta_{L} \mu_{L}}\right)^{\frac{1}{\theta_{L}}}} \\
& \text { Faster/Cheaper Commute } \\
& \text { Faster/Cheaper Leisure Travel }
\end{aligned}
$$

- Wages adjust due to business trips:

$$
\hat{w}_{i}^{1-\mu_{B}-\mu_{H_{Y}}} \hat{r}_{j}^{\mu_{H_{Y}}}=\hat{A}_{i} \underbrace{\left(\sum_{j} \sum_{m} \lambda_{i, j, m}^{B}\left(\hat{A}_{j} \frac{\hat{\tau}_{i, j, m}^{-\rho}}{\hat{t}_{i, j, m}}\right)^{\theta_{B} \mu_{B}}\right)^{\frac{1}{\theta_{B}}}}_{\text {Faster/Cheaper Business Travel }}
$$

-     + market-clearing (land, labor)
-     + spillover conditions (amenities, productivity)

## Commuters' Preferences over Transport Modes

$$
\ln \lambda_{i, j, m}^{C}=\nu_{i, m}^{C}+\theta_{C} \ln \left(w_{i, j}-t_{i, j, m}\right)-\theta_{C} \rho \ln \tau_{i, j, m}+\varepsilon_{i, j, m}
$$

| Note: ${ }^{a}$ denotes $1 \%$ significance; ${ }^{b}$ denotes $5 \%$ significance; and ${ }^{6}$ denotes $10 \%$ significance. Robust standard errors are displayed in parenthesis. All specifications are conditional on the estimates $\hat{\theta}_{C}=2.97$ and $\hat{\rho}_{C}=0.75$. |  |  |  |  |  |  |  |  |

## Potential CHSR Routes (1996 Report)

Note: this figure shows a digitization of the three planned routes reprinted in page 113 of part 1 of the 2005 CHSR Environmental Impact Report. Each route includes multiple branches that could be used within a route.

## Alternative Models

| Model: | Baseline |  | Full |  | Pessimistic |  | + Car |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Inst. Var.: | Random Station (1) | Random Path (2) | Random Station (3) | Random Path (4) | Random Station (5) | Random Path (6) | Random Station (7) | Random Path (8) |
| $\log \left(\hat{W}_{19}\right)$ | $\begin{aligned} & 19.45^{a} \\ & (1.68) \end{aligned}$ | $\begin{aligned} & 22.68^{a} \\ & (1.80) \end{aligned}$ | $\begin{aligned} & 17.51^{a} \\ & (1.48) \end{aligned}$ | $\begin{aligned} & 18.92^{a} \\ & (1.54) \end{aligned}$ | $\begin{aligned} & 41.62^{a} \\ & (3.55) \end{aligned}$ | $\begin{aligned} & 47.20^{a} \\ & (3.72) \end{aligned}$ | $\begin{aligned} & 19.17^{a} \\ & (1.46) \end{aligned}$ | $\begin{aligned} & 23.15^{a} \\ & (2.00) \end{aligned}$ |

Note: ${ }^{\text {a }}$ denotes $1 \%$ significance level. Robust standard errors in parenthesis. All specifications control for county fixed effects. Columns (1) and (2) present baseline estimates. Columns (3) and (4) present results for the model that incorporates general equilibrium effects. Columns (5) and (6) present results for the "pessimistic" model, which assumes a 0.5 probability that the CHSR is completed in 24 years. Columns (7) and (8) present results for a version of the model that allows the CHSR to be a perfect substitute to traveling by car.

## Alternative Models, Political Covariates Only

| Model: | Baseline |  |  | Full |  | Pessimistic |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
