NBER Monetary Economics Program Meeting, Fall 2024

Disclaimer: The views expressed in this paper are those of the authors and do not necessarily represent those of the Bank of Canada.

## Motivation

Housing inequality across racial groups remains a significant and persistent issue

▶ **Homeownership gap:**

75% of White households own homes vs. <50% for Black and Hispanic households

▶ **Price appreciation disparity:**

2006-2017, 7% ↓ in Black neighborhoods vs. 2% ↑ in White neighborhoods

Housing inequality limits Black and Hispanics' capacity to build equity and wealth

# Motivation

Existing literature: significant and sizable impact of monetary policy on housing

- ▶ Williams, 2016: 100 bps ↓ fed funds rate ⇒ real house prices ↑ 6% in 2 years
- ▶ Ungerer, 2015: 100 bps ↓ fed funds rate ⇒ housing sales rate ↑ 20% immediately

However, the literature largely overlooks whether monetary policy influences housing market outcomes (e.g., transactions and prices) differently for various racial groups.

- ▶ We attempt to address this gap in knowledge

## This paper studies how monetary policy impacts Black and Hispanic households

### Our strategy:

- ▶ compile a new race-specific housing market metrics database
  - ▶ construct measures of **home purchases and sales** by race
  - ▶ estimate repeat-sale **home price indices** by homeowners' race
  - ▶ quarterly frequency, covering 136 U.S. cities from 1995 to 2017
- ▶ study the heterogeneous effects of monetary policy on housing outcomes
- ▶ explore the potential transmission mechanisms

## Overview of Findings

Relative to White households, Black and Hispanic households experience

- ▶ **greater reduction** in **net home purchases** after **contractionary** monetary policy
- ▶ **greater reduction** in **home price appreciation** after **contractionary** monetary policy

Potential mechanisms: the financing channel and the employment channel

- ▶ fed funds rate has similar pass-through to mortgage rates across racial groups
- ▶ but it exerts a stronger influence on Black and Hispanic employment

Effects of racial segregation within a city:

- ▶ Neighborhood matters!  
For a given race, those living in minority neighborhoods experience greater home price depreciation compared to those in predominantly White neighborhoods

# Literature

- ▶ Monetary Policy and Racial Inequality:
  - ▶ Bartscher et al. (2022), Lee, Macaluso, and Schwartzman (2021), Bergman, Matsa, and Weber (2022), Nakajima (2023), Gerardi, Willen, and Zhang (2022), Ringo (2024)...
- ▶ Racial Inequality in Housing:
  - ▶ Bayer, Ferreira, and Ross (2016), Bayer et al. (2017), Bayer, Ferreira, and Ross (2018), Kermani and Wong (2021), Diamond and Diamond (2024)...

# Data

## We construct race-specific housing metrics by linking micro CoreLogic and HMDA data

- ▶ CoreLogic
  - ▶ property information (e.g., location)
  - ▶ housing transactions (e.g., exact date, price)
  - ▶ mortgage transactions (e.g., exact date, loan type, loan amount, lender name, mortgage rate whenever available)
- ▶ Home Mortgage Disclosure Act (HMDA)
  - ▶ the near-universe of mortgage application records:  
year, census tract, **race**, **ethnicity**, income, loan type, loan amount, lender name, etc.
- ▶ Linking CoreLogic with HMDA
  - ▶ match exactly on year, census tract, and loan type/amount
  - ▶ select the closest match based on textual similarity of lender names
  - ▶ drop low-quality matches

## Matching rate is 54%

- ▶ In line with the matching rate in Bayer et al., 2016
- ▶ similar across different types of neighborhoods

Neighborhood White Pop. Share	# of CoreLogic Transactions	# of Matches	Matching Rate
Low	20641040	10768551	0.52
Middle	20784490	11268578	0.54
High	21017432	11517090	0.55
Neighborhood Median Income	# of CoreLogic Transactions	# of Matches	Matching Rate
Low	20681980	10873438	0.53
Middle	20720888	11156979	0.54
High	20484524	11229846	0.55

▶ Advantages of our method to construct race-specific housing metrics

## Reformat the CoreLogic-HMDA Micro Data

- ▶ keep only the completed spells where both purchases and sales are observed
- ▶ include arm-length single-family home transactions, except when a house is purchased without a mortgage or by a corporation
- ▶ exclude cases where a house is sold within 6 months of purchase

**Our final sample comprises over 13 million completed ownership spells**

## Race-specific Home Purchase and Sale

We focus on three racial groups in our analysis:

- ▶ Non-Hispanic White (White)
- ▶ Non-Hispanic Black (Black)
- ▶ Hispanic

We construct a database at the [City-Quarter-Race](#) level from 1995-2017 that include

- ▶ Home purchases, home sales (raw counts & dollar volumes)
- ▶ Average mortgage rate, purchase with Federal Housing Administration (FHA) loans, foreclosures, etc

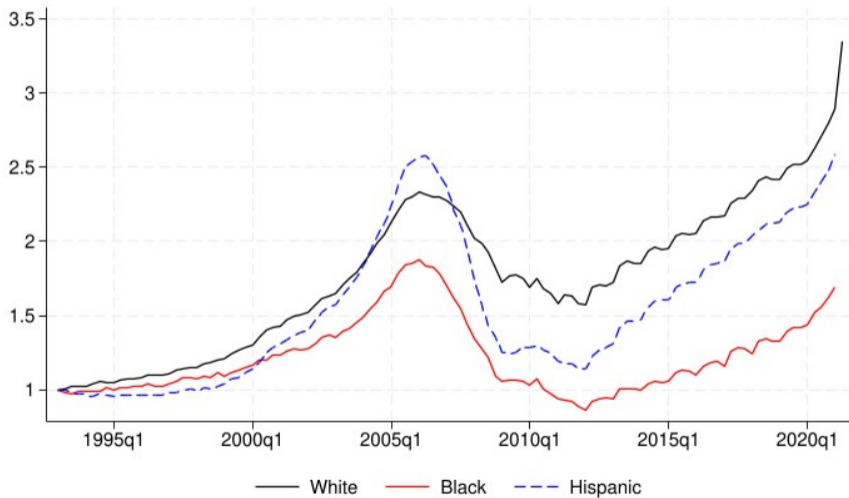

## Race-specific House Price Indices

- ▶ split completed ownership spells by race of homeowners
- ▶ estimate repeated sale HPI separately for each city  $l$  and race  $r$ :

$$\log p_{i,l,t'} - \log p_{i,l,t} = b_{l,t'}^r - b_{l,t}^r + \epsilon_{i,l,t,t'}.$$

- ▶  $t'$  and  $t$  are the sale and purchase quarter, respectively
- ▶  $p_{i,l,t'}$  and  $p_{i,l,t}$  are the sale and purchase price of house  $i$ , respectively
- ▶  $r$  is the race of homeowner of house  $i$  from  $t$  to  $t'$
- ▶  $b_{l,t'}^r$  and  $b_{l,t}^r$  are coefficients to be estimated  
 $b_{l,t}^r$  represents log HPI of race  $r$  in city  $l$  and quarter  $t$
- ▶ **Home price appreciation** at the **City-Quarter-Race** level, measured by  $\Delta \log(\text{HPI})$

## Race-specific House Price Indices at national level

## Other city-level data

- ▶ Labor market
  - ▶ **race-specific** full-quarter employment (stable) from the US Census Bureau's Quarterly Workforce Indicators program
  - ▶ **race-specific** end-of-quarter hiring rate
  - ▶ **race-specific** beginning-of-quarter separation rate
  - ▶ unemployment rate from Bureau of Labor Statistics
- ▶ Income and earnings  
**race-specific** average earnings data; income per capita
- ▶ Racial composition  
the Black population share and Hispanic population share
- ▶ Lender concentration  
the share of mortgages held by the top four lenders, Herfindahl–Hirschman Index

## Empirical Strategy

## Empirical Strategy

Use the panel data local projections method to estimate a dynamic system of  $[i_t, Y_{l,t}]$

- ▶  $i_t$  represents the average federal funds rate in quarter  $t$
- ▶  $Y_{l,t}$  include the log of home purchases and sales, home price appreciation, employment growth, and log earnings **for three racial groups** in city  $l$  in quarter  $t$

The setup allows:

- ▶ joint dynamics of local labor and housing market outcomes (Guren et al., 2021)
- ▶ outcome variables are observed for each racial group
- ▶ interactions among different racial groups

## Main specification

$$y_{l,t+h} = \beta_y^{(h)} i_t + \text{controls} + \text{error}_{l,y,t}^{(h)}, \quad h = 0, 1, 2, \dots,$$

- ▶  $y_{l,t+h}$  is one of the variables in  $Y_{l,t+h}$
- ▶ controls includes four lagged values of  $Y_{l,t}$  and  $i_t$
- ▶ city fixed effects are also included
- ▶ we use the total population in each city as weights

$0.25 \times \beta_y^{(h)}$  measures the effect of a 25 bps increase in  $i_t$  on  $y_{l,t+h}$

## Instrumental variable for monetary policy

**Endogeneity issue:**  $i_t$  is set by the FOMC in response to macroeconomic conditions

**Solution:** use high-frequency monetary policy surprises as an instrumental variable

- ▶ constructed from asset price changes occurring in 30-minute windows around FOMC announcements
- ▶ Our baseline results use the Bauer and Swanson (2023) series  
asset price changes are purged to make them plausibly exogenous to all publicly known macroeconomic variables before the FOMC decisions
- ▶ We also used alternative monetary policy surprises: the first principal component of asset price changes as in Nakamura and Steinsson (2018)

# Monetary policy shock at quarterly frequency

Discussion  
○○○○○○○○○○○○

Conclusion  
○○○

## Main results

## Black and Hispanic households reduce **gross purchase** relative to White households

In response to a 25 bps increase in  $i_t$

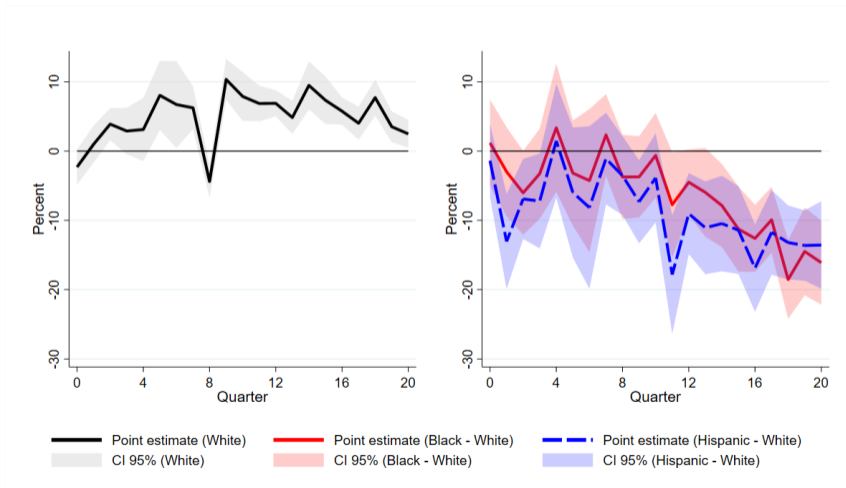

## Black and Hispanic households increase **gross sales** relative to White households

In response to a 25 bps increase in  $i_t$

# Net Home Purchase = $\ln(\text{gross purchase}) - \ln(\text{gross sale})$

16 quarters after, Black and Hispanic decline by 12.6 and 16.9 pp, relatively

## Sum up

The relative **reductions in home purchases** and **increases in sales** jointly lead to the **diminished net purchase** intensity of Black and Hispanic households compared to White households following monetary tightening.

## What causes Black and Hispanic households to retreat from the housing market?

### Potential Mechanisms

- ▶ the financing channel  
Lower mortgage interest rates reduce the cost of borrowing for home buyers
- ▶ the employment channel  
Receiving mortgage approval necessitates a work history spanning at least 2 years

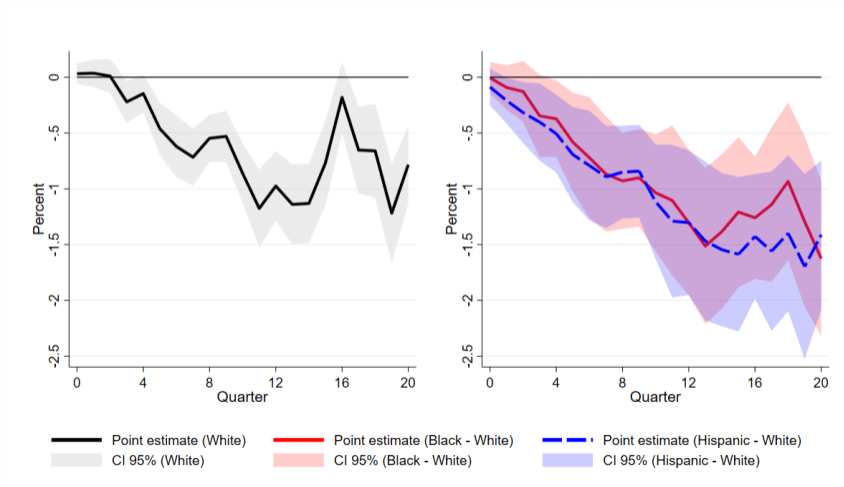

## Potential Mechanisms – Mortgage Rate

$i_t$  has a similar pass-through to the average mortgage rate (at purchase) across race

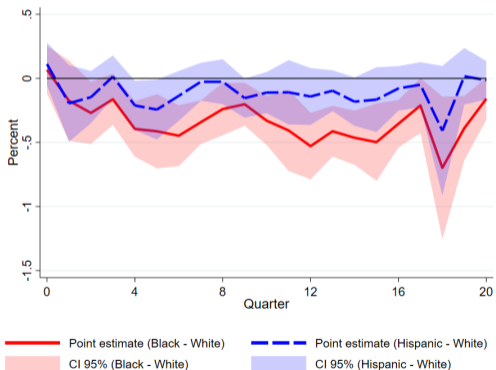

## Potential Mechanisms – Employment

$i_t$  has heterogeneous effects on cumulative employment growth by race

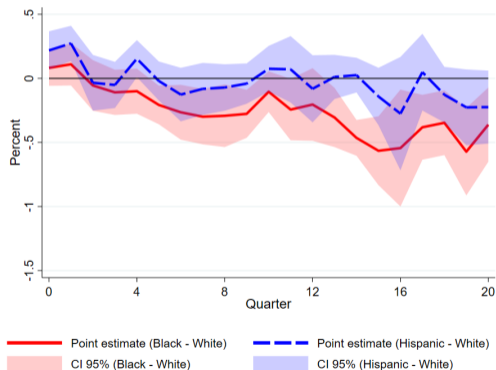

# Separation margin actually helps minority workers, but the hiring margin dominates

## Figure: Hiring Rate

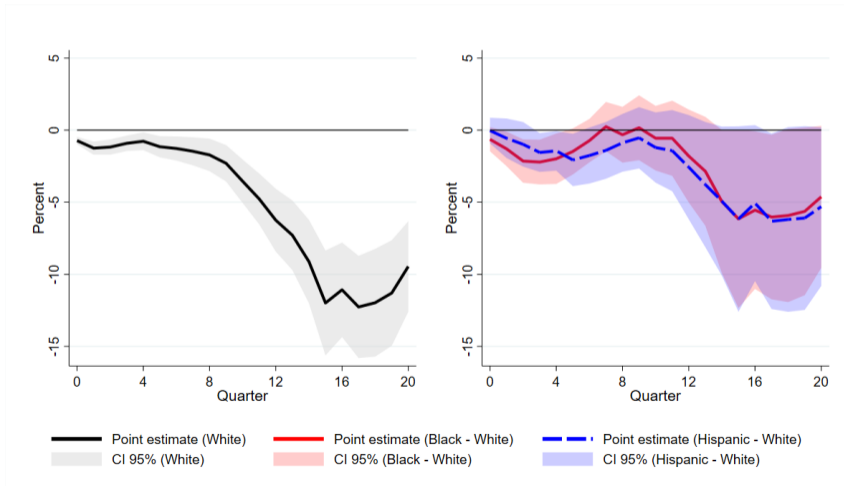

## Figure: Separation Rate

# Cumulative home price appreciation

16 quarters after, Black and Hispanic decline by 5 and 5.5 pp, relatively

## Discussion

## Effects of Residential Segregation

What might explain the disparity in home price appreciation after monetary tightening?

- ▶ There is a causal relationship between homeowners' race and purchase/sale prices
- ▶ Another possibility is that it is about residential segregation by race
  - ▶ Black and Hispanic homeowners often live in minority neighborhoods
  - ▶ Black and Hispanic households' housing demand is more sensitive to monetary policy
  - ▶ Their home price appreciations may be more significantly affected by monetary policy

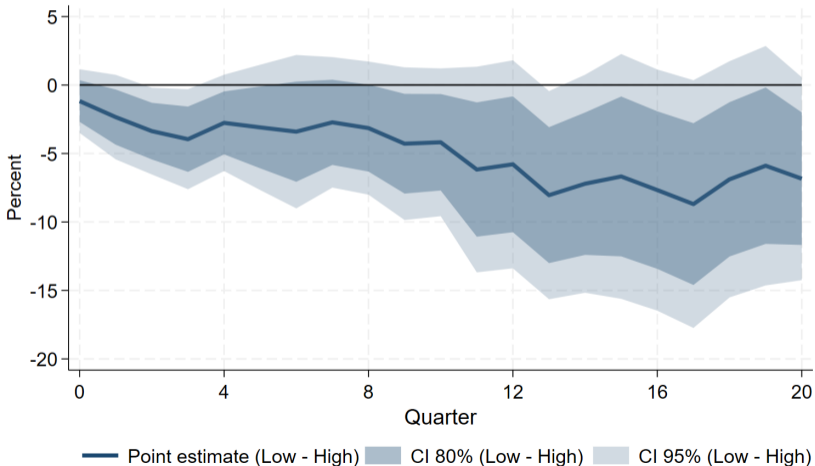

## To explore the role of residential segregation in shaping racial disparities

For each city-quarter,

- ▶ split homeowners into three groups, based on the White population share within census block group:  
those living in minority, mixed and predominantly White neighborhoods
- ▶ construct race-specific home purchases, sales, HPIs, for each type of neighborhood

# White Homeowners in minority neighborhoods encounter steeper declines in housing prices than those in predominantly white neighborhoods

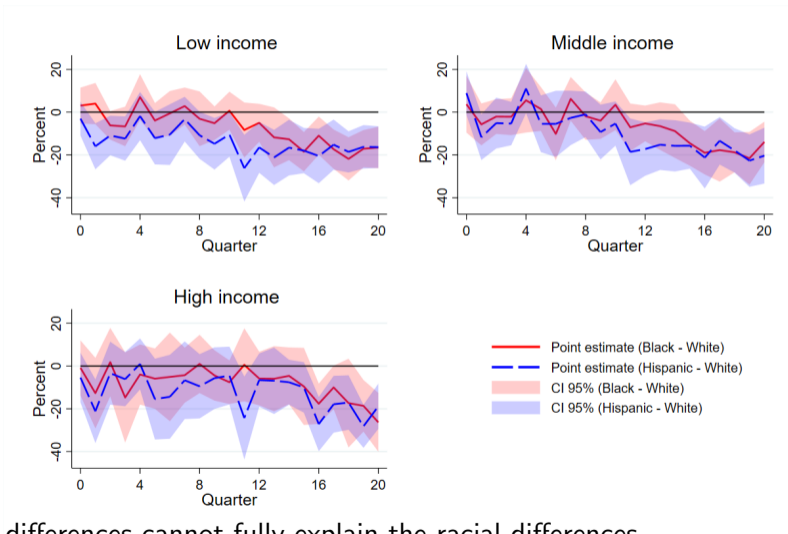

## Discussion: Role of Income

Does the observed racial heterogeneity purely arise from persistent income disparities?

To answer this question,

- ▶ In the baseline regression, we control the race-specific earnings at city-quarter level
- ▶ The impulse responses of log earnings are similar across racial groups
- ▶ In addition, for each city-quarter,
  - ▶ split homeowners into three income groups: low, middle, and high, based on the quantiles of mortgage applicants' income
  - ▶ construct race-specific home purchases, sales, HPIs, for each income group

# Net Purchase Intensity by Applicant's Income

⇒ income differences cannot fully explain the racial differences

## Discussion: from home purchase to homeownership

Does the decrease in home purchases necessarily lead to a reduced homeownership?  
Could it be a reduction in the upgrading of homes or purchases of second homes?

We look at **home purchases** with **Federal Housing Administration (FHA) loans**

83 percent of FHA purchase mortgages were issued to first-time home buyers

Thus, FHA purchases are good proxies for entries into homeownership.

## Home Purchase with FHA loans

⇒ monetary tightening leads to a relative reduction of entries into homeownership for Black and Hispanic households

## Discussion: Role of Foreclosure

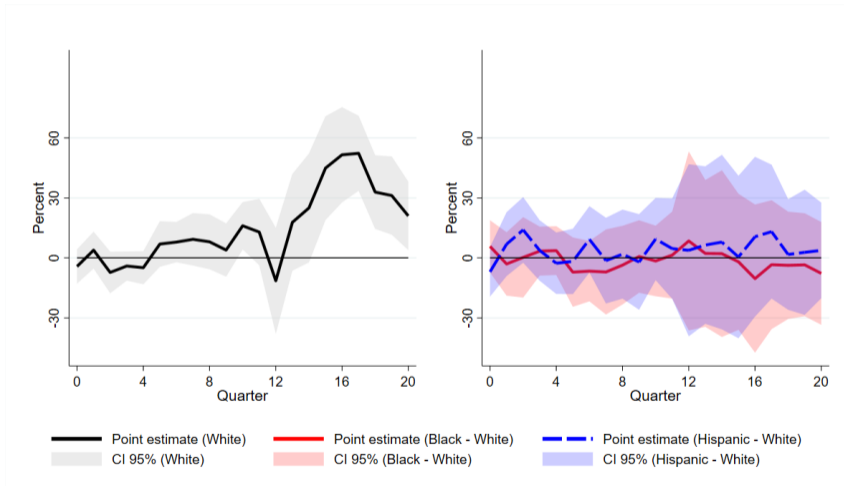

Studies, e.g., Kermani and Wong (2021) and Diamond and Diamond (2024), have looked at the racial disparities in foreclosures

Our baseline results include foreclosures as a form of sale

Are the racial differences in response to monetary policies driven by foreclosure?

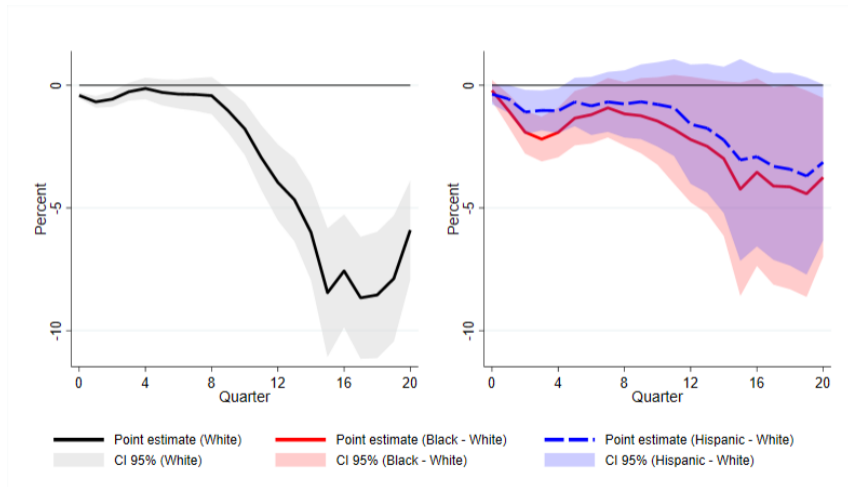

⇒ we can also separately examine foreclosure and foreclosure-free HPIs

# The response of foreclosure is quite similar across races

## Looking at foreclosure-free HPI, minority still experiences larger declines

Both results suggest that foreclosure is not the main mechanism that causes racial heterogeneity in response to monetary policy.

▶ Additional Discussions: asymmetric effects of monetary policy

▶ Additional Discussions: cash vs. mortgage homebuyers

○○○○○○○○○○○○

Conclusion  
●○○

# Conclusion

## Key Points

- ▶ Black and Hispanic households exhibit heightened sensitivity in their housing responses to monetary policy shocks compared to White households
- ▶ Our analysis underscores the importance of the employment channel in explaining the excess responsiveness of Black and Hispanic housing outcomes to monetary tightening
- ▶ Racial differences in the response of home prices to monetary policy can be attributed to residential segregation by race

## Policy Implications

Our research highlights the importance of recognizing the uneven effects of monetary policy on housing outcomes for Black and Hispanic households.

- ▶ To alleviate the uneven effects, policymakers might consider targeted measures, such as hiring credits and employment protection subsidies, to support labor market opportunities for Black and Hispanic groups during monetary tightening.
- ▶ Additionally, promoting minority homeownership in predominantly White neighborhoods and reducing residential segregation could help stabilize home values for Black and Hispanic households.

  Point estimate (Hispanic - White)

CI 95% (White)    
  CI 95% (Black - White)    
  CI 95% (Hispanic - White)

## Additional Discussions: asymmetric effects of monetary policy?

$$\begin{aligned}
 y_{l,t+h} = & \beta_y^{\text{pos},(h)} \max(\text{MP}_t, 0) + \beta_y^{\text{neg},(h)} \min(\text{MP}_t, 0) \\
 & + \text{controls} + \text{error}_{l,y,t}^{(h)}, \quad h = 0, 1, 2, \dots
 \end{aligned}$$

- ▶ **Contractionary** monetary policy **disproportionately** harms Black and Hispanic households, leading to greater drops in net purchases, larger decreases in home price appreciation, and worse employment outcomes; conversely
- ▶ Expansionary policy **does not** disproportionately benefit these minority groups

▶ [Back to Additional Discussions](#)

## Additional Discussions: cash vs. mortgage homebuyers

Using HMDA to identify home buyers' race means that we miss all cash transactions

Cash vs. mortgage purchase is a margin of substitution that may be affected by MP

We approximate the race-specific mortgage purchase share by calculating the ratio of ZIP code-based race-specific mortgage purchases to total purchases (including both mortgage and cash)

Monetary policy **does affect substitution**, but there is **no significant** racial heterogeneity
