Aside: Estimating (Innovation) Production Functions

Exponential Production Functions a simple starting point

- **Structural prod. func.**: log(Y
- **Objective func.**: output maximization subject to budget
- **Optimal investment policy**: X

A good research design requires understanding $i(\ldots)!$

$$Y_{it}) = a + \beta \log(X_{it}) + \omega_{it} + \epsilon_{it}$$

$$X_{it}^* = i(\omega,...)$$

Stocks and Flows $\log(Y_{it}) = a + \beta_1 \log(X_{it}) + \beta_2 \log(X_{i(t-1)}) + \omega_{it} + \epsilon_{it}$

- Zvi Griliches: "knowledge stock" = (1
 - Depreciates at a rate $\delta < 1:$ some R&D outputs are persistent knowledge
 - Depreciates at a rate $\delta \geq 0$: some R&D inputs are variable costs
 - "Issues in assessing the contribution of research and development to productivity growth." The Bell Journal of Economics (1979)
- Bronwyn Hall: nitty-gritty (but important!) empirics of R&D stocks
 - "Measuring the Returns to R&D: The Depreciation Problem." NBER Working Paper (2007)

$$-\delta^{0}X_{it} + (1-\delta)^{1}X_{i(t-1)} + (1-\delta)^{2}X_{i(t-2)} + \dots$$

Production Functions and Fixed Effects $\log(Y_{it}) = a_i + \beta_1 \log(X_{it}) + \omega_{it} + \epsilon_{it}$

Griliches & Mairesse: "Production Functions: The Search for Identification." (1995)

"Researchers, in trying to evade the simultaneity problem..."

- [by using panel data, including producer-fixed effects, and
- assuming that X_{it} and ω_{it} are independent conditional on a_i]
- "...have shifted to the use of thinner and thinner slices of data..."
 - [identifying β only via variation from $\log(X_{it}) \alpha_i$]
 - exacerbating other problems and misspecifications."

Unit of analysis: D(isease)-S(cience)-T(ime)

- No scientist does research "on cancer"
- Here, research area = disease-science area for a given year
- Advantages
 - disease-science area? (e.g. genetic basis of Alzheimer's)
 - identification)

• Work involves a science area and a disease application (e.g., cell signaling in cancer)

• Work that uses similar tools / biological-pathways (science) to make progress towards treatments for the same **illness, injury, or disorder** (disease) in the same **year** (time)

• Allows a policy-relevant question: what happens if we provide more funding for a

• D-S-T are not explicit units of funding for NIH administration (which will help with

Defining each D-S-T

Defining each D-S-T

- Defining "diseases":
 - NIH consists of 27 disease(ish)-focused Institutes/Centers
 - A grant application must report its disease area to be funded
- Defining "science":
 - Grant review happens in 180 science(ish)-focused "study sections"
 - A grant application must specify its science area to be evaluated
- Defining "time":
 - Fiscal years

Empirics $Patents_{222} = a + \beta Funding_{dst} + \epsilon_{dst}$

- Where to look for outcomes? (because patents aren't explicitly assigned to DSTs) • It is hard to know a priori what scientific results are relevant for a patent

 - Link grants to patents via:
 - Paper trail: acknowledgements NIH funding directly used
 - Paper trail: citations patent cites a paper that NIH funded
 - ``Nearby'' in disease-science space (i.e., using similar language)

Finding Patents connected to NIH investments

- Direct acknowledgment: # patents by NIH-funded researchers
 - Grant → Patent
 - Answers: Does the NIH directly fund patentable research?
- Citation-linked: # patents citing NIH-funded research
 - Grant → Publication → Patent
 - Answers: Does the NIH fund research that is directly useful to inventors?
- ``Near-by'': # patents intellectually related to an NIH funding area
 - Grant → Publication → Related Publication → Patent
 - Answers: Does the NIH fund research that is indirectly useful to inventors?

Identification $Patents_{d(\delta)s(\sigma)t(\tau)} = a + \beta Funding_{dst} + \epsilon_{dst}$

- **Concern**: *Funding*_{dst} may be correlated with ϵ_{dst}
- Approach 1: Fixed effects
 - Assumption: $\epsilon_{dst} = (FE_d \times FE_s) + (FE_d \times FE_t) + (FE_s \times FE_t) + \mu_{dst}$
 - Scientists and the NIH (may) know everything, except for μ_{dst}
- Approach 2: Instrumental variable "windfall" funding due to funding rules
 - DST funding is made up of funding for individual grants.
 - Grant applications are given cardinal scores, but funded on the basis of ordinal scores.
 - Instrument $Funding_{dst}$ with funding for the subset of grants funded for this reason

"Windfall" Funding

Tumor Physiology Study Section

Main Results: NIH \$ \rightarrow

- 30% of NIH grants produce research that is cited by a private sector patent
- \$10 million of NIH funding \rightarrow 2.3 more industry patents
- NIH funding increases overall firm R&D investment
 - Increased firm patenting in one area is not offset by declines in another; rather, both appear to increase
- \$1 dollar in NIH funding \rightarrow \$0.4 to \$1.7 in PDV of drug revenue
- Disease spillovers are large
 - Half of all patents generated by additional NIH investments are for diseases different from the one intended

Estimating Spillovers from Publicly-Funded R&D: Evidence from the US Department of Energy

Myers & Lanahan American Economic Review 112, no. 7 (2022): 2393-2423

Motivation: R&D spillovers (ex-post rationalization of being a 1st-year AP)

- In theory, positive externalities from science \Rightarrow gov't invests in science
- But little (micro) evidence on how big and "where" those externalities might be
 - Azoulay, Li, Graff Zivin, & Sampat. "Public R&D Investment and Private Sector Patenting." The Review of Economic Studies (2019). [basic, biomed.]

Article Information

Abstract

Governments regularly subsidize new ventures to spur innovation. This paper conducts the first large-sample, quasi-experimental evaluation of R&D subsidies. I use data on ranked applicants to the US Department of Energy's SBIR grant program. An early-stage award approximately doubles the probability that a firm receives subsequent venture capital and has large, positive impacts on patenting and revenue. These effects are stronger for more financially constrained firms. Certification, where the award contains information about firm quality, likely does not explain the grant effect. Instead, the grants are useful because they fund technology prototyping. October 01 2018

Approximating Exogenous Variation in R&D: Evidence from the Kentucky and North Carolina SBIR State Match Programs

Abstract

This paper exploits policy discontinuities at U.S. state borders to examine the effect of R&D investments on innovative projects. We examine the Small Business Innovation Research (SBIR) State Match program, which offers noncompetitive grants to federally awarded SBIR Phase I projects that are eligible to compete for Phase II. Results from SBIR activity (2002–2010) indicate heterogeneous treatment effects. Notably, the positive differential effects are moderated by firms within the science and health fields and with less previous SBIR success. The State Match effectively stabilized Phase II trends in contrast to neighboring states that experienced greater declines from the concurrent recession.

SBIR at the DOE (and lots of other public science programs)

- Small business: for-profit company with \leq 500 employees
- SBIR award: ~\$150K (Phase I) & ~\$1.5M (Phase II) grants for R&D

with \leq 500 employees 5M (Phase II) grants for R&D

SBIR at the DOE: Targeted investment (and lots of other public science programs)

Technical Topic Descriptions FY 2012 Release 1

Small Business Innovation Research (SBIR) And Small Business Technology Transfer (STTR) Programs

> August 2011 Version 2

In support of the Department of Energy's (DOE's) secure and sustainable energy mission the Office of Biological and Environmental Research seeks to advance fundamental understanding of coupled biogeochemical processes in complex subsurface environments to enable systems-level prediction and decision support. This basic scientific understanding is applicable to a wide range of DOE relevant energy and environmental challenges including:

- Cleanup of contaminants and stewardship of former weapons production sites
- Underground storage of spent nuclear fuel
- Carbon cycling and sequestration in the environment
- Nutrient cycling in the environment in support of sustainable biofuel development
- Fossil fuel processing and recovery from the deep subsurface.

20. TECHNOLOGIES FOR SUBSURFACE CHARACTERIZATION AND MONITORING (PHASE I, \$150,000/PHASE II, \$1,000,000)

Subsurface Insights, Inc. A case study

- Initial location: New Hampshire
 - Later: projects across U.S. & Europe
- Initial SBIR topic: monitor contamination zones
 - Later: supplying aquifer thermal energy storage companies

SBIR at the DOE: Targeted investment (and lots of other public science programs)

Mapping investments (SBIR \$) to technology-space (CPC codes) text-similarity

Step 1: "Read" FOA Topics i.e. 2005 DOE Release 1, Topic #1

1. ADVANCED POWER ELECTRONICS FOR ENERGY STORAGE, TRANSMISSION, AND DISTRIBUTION APPLICATIONS

Power electronic conversion systems (PCS) constitute major cost elements and reliability issues in most distributed generation and energy storage systems. As these systems move to higher power levels, it is desirable to improve the functionality and manufacturability of the power conversion systems. Several paths to improvement are possible. Moving from silicon to silicon-carbide based devices has the potential to increase power rating and switching frequency while replacing electrolytic capacitors with other components offers the potential of significantly increasing the reliability of these devices.

Step 3: "Map" Classes to FOA Topics per Patent Similarity

- 1. H01L2924: methods for connecting or disconnecting semiconductor or solid-state bodies
- 2. <u>H01L28</u>: passive two-terminal components without a potentialjump or surface barrier for integrated circuits
- 3. H01L27: devices consisting of a plurality of semiconductor or other solid-state components formed in or on a common substrate

Mapping investments (SBIR \$) to technology-space (CPC codes) face validity of text-similarity mapping

Figure A.2: FOA Example #1–Solar Energy

(a) FOA Text

2. ADVANCED SOLAR TECHNOLOGIES

Solar energy is our largest energy resource and can provide clean, sustainable energy supplies including electricity, fuels, and thermal energy. The President's economic recovery package emphasized solar energy, among others, as a key element in combating global climate change However, the cost-effective capture of the enormous solar resource is problematic. This topi seeks to develop novel, commercially feasible, solar systems and production techniques.

Grant applications submitted in response to this topic should: (1) include a review of the state-of the-art of the technology and application being targeted; (2) provide a detailed evaluation of the proposed technology and place it in the context of the current state-of-the-art in terms of ifecycle cost, reliability, and other key performance measures; (3) analyze the proposed technology development process, the pathway to commercialization, the large potential markets it will serve, and the attendant potential public benefits that would accrue; and (4) address the tation of the new technology

Phase I should include (1) a preliminary design; (2) a characterization of laboratory-scale devices using the best measurements available, including a description of the measuremen (3) a road map with major milestones, leading to a production model of a system that would be built in Phase II. In Phase II, devices suitable for near-commercial applications must be built and tested, and issues associated with manufacturing the units in large volumes at a competitive price must be addressed.

Grant applications are sought in the following subtopics:

a. Manufacturing Tools for Reliability Testing-Grant applications are sought for the development of tools that can be used to conduct reliability testing in PV module manufacturing environments. For example, tools such as light soaking equipment are used to prepare module or components for accelerated lifetime testing, which is frequently conducted in-house at the module manufacturing facility or by service companies before sending for official third party certification. New tools are needed for the testing of components (e.g., modules, inverters) or ubcomponents (e.g., cells, microinverters, individual layers of a module), and should combine high performance, low cost, and a small floor footprint.

Questions - contact: Alec Bulawka (Alec.Bulawka@ee.doe.gov) James Kern (James.Kern@ee.doe.gov

b. Module and System Manufacturing Metrology and Process Control-The rapid scale-up of the manufacturing of photovoltaics, particularly for new thin-film technologies, is challenging the possibility of using conventional technologies to make real-time non-destructive nts of material characteristics in high-volume, high-production-rate environ then using this information to implement real-time process control of the manufacturing process Therefore, grant applications are sought for the development of novel, advanced, real-time nondestructive materials characterization tools for use in high-volume manufacturing lines for photovoltaic systems.

Questions - contact: Alec Bulawka (<u>Alec.Bulawka@ee.doe.gov</u>) James Kern (James Kern@ee.doe.gov

c. Photovoltaics (PV) System Diagnostic Tools—The current rapid growth of the PV industry has led to diverse and innovative product designs, which frequently require non-traditional tests ability and performance. Examples of these non-traditional tests include perform testing and tracking requirements for concentrating PV modules, and software-based system diagnostic tools. Grant applications are sought for innovative methods to monitor PV system and component performance, in order to identify failures and loss mechanisms and to minimiz system down time. Approaches of interest include the development of diagnostic tools that are oriented and internal to the system components, or those that can be integrated - i.e "piggy-backed" - through ancillary application.

Questions - contact: Alec Bulawka (Alec.Bulawka@ee.doe.gov) James Kern (James.Kern@ee.doe.gov

	Static electricity; naturally-occurring electricity
	Cyclically operating valves for machines or engines
20	Cranes; load-engaging elements or devices for cranes
	Locomotives; motor railcars
	Wireless communication networks

Notes: Topic #2 from the FY2010 Release 1 Funding Opportunity Announcement.

4. GEOTHERMAL ENERGY TECHNOLOGY DEVELOPMENT

This topic is focused on the development and innovation required to achieve technical and commercial feasibility of EGS. Because of the complexity of these systems, grant application are expected to focus on a component or supporting technology of EGS development that would ents to the overall system. The unique function and innovation of the targete subsystem or supporting technology must be clearly described and its function in relationship t the greater EGS system must be expressed clearly. Approaches can be targeted at any of the multi-step project stages for technology development: from design concept, through scale mod development (if applicable), to laboratory testing, field testing, and commercial scale

Grant applications are sought in the following subtopics:

a. High Temperature Downhole Logging and Monitoring Tools—Challenging subsurface conditions are one of the barriers to an accelerated ramp-up of geothermal energy generation. To address this challenge, grant applications are sought to develop logging and monitoring tools that are capable of tolerating extreme environments of high temperatures and pressures. The are capable of oreitaing externe environments of high emperatures and pressures. The instruments of interest include, but are not limited to, temperature and pressure sensors, flow meters, fluid samplers, inclination and direction sensors, acoustic instruments (high and low frequency), resistivity probes, natural gamma ray detectors, epithermal neutron scattering uges, rock tearly gauges (gamma and sonic), easing monitoring devices (e.g. cement bond gs and casing collar locators), fluid conductivity, pH indicators and well dimension probes (caliper). The target temperatures and pressures for these logging and monitoring tools should be supercritical conditions (374° C and 220 bar for pure water), and the tools may be used at depths of up to 10,000 meter

Questions - Contact Raymond Fortuna, 202-586-1711, raymond.fortuna@ee.doe.gov

b. Cements for EGS Applications-While conventional geothermal wells experience large temperature rises during production, EGS wells experience large temperature drops at the bottor of the well during the stimulation process, due to the cooling effect of the injected water. This temperature drop may be in the neighborhood of 350°F. This unique situation causes significa stress and potential failure of the cement sheath if conventional cement systems are utilized. To address this issue, grant applications are sought for the research, design, development, testing, and demonstration of a cement system for the high temperature and stress conditions of an EGS wellbore. Proposed approaches may define cement formulations that would be used by the thermal industry to place the cement within a long string of casings; such approaches should focus on preventing a premature set and maintaining a strong seal at the shoe (so that stimulations may be performed through the casing).

ions - Contact Raymond Fortuna, 202-586-1711, raymond.fortuna@ee.doe.gov

c. Drilling Systems-High upfront costs, largely due to high drilling costs, are a major barrier to expanded geothermal energy production in the United States. Therefore, grant applications are sought to reduce drilling costs by developing a drilling technology (horizontal and/or directiona that is capable of drilling three times faster than conventional rotary drilling. Approaches of nterest include, but are not limited to the design and development of improved drilling fluids (to reduce frictional viscosity and remove cuttings), high-performance bottom-hole assemblies (e.g collars, bent subs, drill bits), and downhole motors (to control wellbore orientation). Propose approaches must demonstrate reliable operation and equipment durability that exceeds the performance of conventional equipment at depths up to 10,000 meters and temperatures up to

creation. In order to advance technology and reduce the upfront risk to geothermal projects, more robust subsurface imaging technologies must be developed. Grant applications are sough to develop improved downhole and remote imaging methods to characterize fractures. Fracture haracterization includes prediction of fracture and stress orientation prior to drilling (needed to roperly orient horizontal wells); determination of fracture location, spacing, and orientation (while drilling); and determination of the location of open fractures (after stimulation), in order o identify the location of fluid flow pathways within the enhanced geothermal reservoir. Proposed approaches should address robust methods for interpreting and imaging the bsurface, including but not limited to, the development of active or passive seismic, proce oftware, and joint inversion of geophysical techniques

 \sim

d. Fracture Characterization Technologies-Subsurface imaging is an important part of

creating a productive EGS reservoir, which requires visualization before, during, and after

tions - Contact Raymond Fortuna, 202-586-1711, raymond.fortuna@ee.doe.gov

e. Working Fluids for Binary Power Plants-Binary power plants are rapidly becoming a major part of the geothermal industry, due to increased development of lower tem eothermal resources. To address cost barriers associated with the working fluids in these binary er plants, grant applications are sought to (1) identify non-azeotropic mixtures of working luids for improved utilization of available energy in subcritical cycles; (2) characterize the mposition and thermophysical and transport properties of those mixtures; (3) identify working uids for supercritical cycles and triansport propries of those matters, (5) fourier work luids for supercritical cycles and triansport properties (and (4) characterize the composition, hermophysical, and transport properties of those working fluids. Proposed approaches may address working fluids or mixtures of working fluids with the potential for greater energy version efficiency than conventional working fluids, such as isobutane or refrigerants

Duestions - Contact Ravmond Fortuna, 202-586-1711, raymond.fortuna@ee.doe.go

f. GHP Component R&D-High initial costs have been identified as a key barrier to widespread GHP deployment. To address this barrier, applications are sought to improve GHP nts to increase efficiency as well as energy savings as compared to conventional stems. Applications may address but are not limited to: variable-speed (VS) components advanced sensors and controls (including water flow sensing), electronic expansion valves, heat change (HX) design and fluids, system optimization, unit control algorithms, and load gement tools.

tions - Contact Raymond Fortuna, 202-586-1711, raymond.fortuna@ee.doe.gov

g. Innovative System/Loop Designs—One of the main barriers in GHP technology is the high ost of drilling and loop installation. Applications are sought for innovative system/loop design that reduce the costs of system and/or loop installation, through new design layouts, system omponents, materials, and/or methods.

38. DATA MANAGEMENT AND STORAGE

a. Green Storage for HPC with Solid State Disk Technologies: From Caching to Metadat Servers-Most solid-state storage devices (SSDs) use non-volatile flash memory, which is made from silicon chips, instead of using spinning metal platters (as in hard disk drives) or streaming tape. By providing random access directly to data, the delays inherent in electro-mechanical drives are eliminated. The common consumer versions, known as flash drives, are compact and fairly rugged. Advantages attributed to SSDs include higher data transfer rates, smaller storage footprint, lower power and cooling requirements, faster I/O response times (up to 1000 times faster than mechanical drives), improved I/O operations per second (IOPS), and less wasted

Furthermore, upcoming processor chip designs from Intel and AMD will include SSD/FLASH controllers built on-board the CPU chip, in order to improve integration for laptop and embedded applications. Such technology is likely to enable a localized checkpoint-restart capability to itigate increased transient failure rates on future ultra-scale computing systems. This increase vel of hardware integration makes it clear that x86 server nodes, which incorporate SSD directly onto the node, are on the horizon.

In view of these developments, the DOE seeks to improve its understanding of the implication of SSDs for large-scale, tightly-coupled systems in High Performance Computing (HPC) environments. Therefore, grant applications are sought to further develop SSD technology as a cost-effective and productive storage solution for future HPC systems, including, but not limite

1) Categorization of SSD failure modes - The rate of deployment of SSDs in HPC environments will be artificially slowed until a better understanding of the failure modes of this new class of storage is achieved. Proposed approaches should categorize the type of failure (wire bond, cell wear-out, or other failure) and determine how the failures would be detected and/or repaired in a composite device fielded in an HPC enviro

2) Use of SSD for node-local storage, for faster (localized) checkpoint/restart (CPR) - If transient failures cause nodes to die, then SSD could be a viable approach for fault-resilience. However, for nodes subjected to hard-failures, the use of SSD could produce an even higher node failure rate, due to the inherent failure characteristics of the SSD; in this case, the SSD approach would not be viable for CPR. Approaches of interest should collect and analyze data on the known failure modes of existing SSD components vis-a-vis node failure modes, in orde to determine if SSD presents an effective alternative to the checkpoint/restart of a shared file

B) Use of SSD for scalable out-of-core applications - Although node-local disk systems have been used to support some applications that use out-of-core algorithms (such as some components of NWChem), the failure rates of spinning disks have rendered this practice unfeasible. Rather, central file systems are used to support these out-of-cent applications, greath affecting their scalability. Approaches are sought to determine whether local SSD might be liable enough to enable a scalable approach to out-of-core proce

 \sim

(a) FOA Text

4) Use of SSD for metadata servers - Metadata servers subject disk subsystems to many ver mall transactions, a feature that is very difficult to support with existing mechanical/spinn isk based systems. SSDs might respond better to the random-access patterns required for metadata servers, but may not perform as well for write functions. Approaches of interest should analyze the data access patterns of a typical HPC Lustre metadata server and, using an SSD performance model, determine how well an SSD-based system would respond to a metadata server load

5) Use of SSD for accelerated caching for the front-end of large-scale disk arrays - Th use of SSDs in caching for large-scale disk arrays is an emerging technology that is not well understood. Approaches are sought to determine of both its performance potential when subjected to real workloads and its fault resilience.

b. Data Management Tools for Automatically Generating I/O Libraries-Database-like self-describing, portable binary file formats, such as Network Command Data Form (NetCDF) and Hierarchical Data Format (HDF), greatly enhance scientific I/O systems by raising the level of abstraction for data storage to very high-level semantics (of data schemas and relationships between data objects stored) rather than low-level details of the location of each byte of the data stored in the file. However, both NetCDF and HDF5 still rely on very complex APIs to describ the data schema, and many performance and the same try on Version was an optimal manner. Consequently, application developers must invest considerable effort in creating their own "shim" I/O APIs that are specific to their applications, in order to hide the complexity of the general-purpose APIs of NetCDF and HDF5.

Grant applications are sought to develop software tools that not only would enable rapid prototyping of high-level data schemas but also would automatically generate a high-level API for presentation to application developers, thereby hiding the complexity of the low-level NetCDF and HDF5 APIs for managing the file format. Such tools also might use auto-tuning chniques to find the best performing implementation of an I/O method

c. Integration of Scientific File Representations with Object Database Management ns-Scientific file formats like Network Command Data Form (NetCDF) and Hierarchic Data Format (HDF5) have capabilities that closely match those of commercial Object Database Management Systems (ODBMS); yet, commercial ODBMSs provide much more sophisticated ata management tools than are available to users of NetCDF and HDF5. Unfortunately, DDBMSs are not designed to accommodate parallel writes to the same data entry from multiple parallel writers. Furthermore, database storage formats are opaque and non-portable, and no file tandard exists to facilitate the movement of data from one database system to another. By standard exists of nathrate information of the and a non-one database system to another. By contrast, NetCDF and HDP5 both offer open, standardized formats and portable, self-describing binary formats for storing data represented as Object Databases.

Empirical model determining boundaries of spillovers

• Iterate:

- 1. Assume spillovers stop after _____ distance
- 2. Estimate model
- 3. Recover goodness-of-fit
- 4. Repeat (1-3), and pray for "convergence"

Empirical model exogenous investments in space-years

- receives a "bonus" valued at 25-100% of the federal SBIR award
- not more/less productive than avg.

• State-specific match programs: if located in state with match, recipient firm

• **Key assumption**: firms (and the tech. they're pursuing) in match policy states are

Empirical model identifying technological and geographic spillovers

 $\mathbf{E}[y_{jt}^d \mid W_{jtb}] = \epsilon$

- Technological spillovers:
 - Count only output from the set of producers who are distance d from SBIR grant recipients
- Geographic spillovers:
 - Focus on investment-output relationship of some fixed amount of similarity (per b)
 - parameters in the same regression: $\theta_{i}^{d=nearby firms}$, vs. $\theta_{i}^{d=distant firms}$ b=more sim tech

$$\exp\left(\sum_{b\in B} W_{jtb}\theta_b^d + \tau_t^d\right)$$

• Within a single regression, see how space-time level output depends on how similar (per b) the investments where in space-time — compare θ_b parameters in the same regression: $\theta_{b=more\ sim\ tech}^{d=nearby\ firms}$ vs. $\theta_{b=less\ sim\ tech}^{d=nearby\ firms}$

• Across regressions, see how output depends on which producers' output is included — compare θ_h b=more sim tech

Results: Evidence of endogenous funding binscatters of investment stocks and patent flows

Figure E.1: Patenting and Funding Conditional on Aggregate Time Trends

Results spillovers are large: productivity depend on what "counts"

Counting all USPTO patents and

- ... only grant recipients
- ... only nonrecipient firms and inventors nearby re-
- ... only remainder of US nonrecipients
- ... all US firms and inventors
- ... all foreign firms and inventors

Counting all firms and inventors, only USPTO patents

- ... very similar to grants' tech. objectives
- ... somewhat similar to grants' tech. objectives
- ... least similar to grants' tech. objectives

Counting all USPTO patents, all firms and inventors

Notes: Reports average marginal products and costs when focusing on a particular set of patents or firms and inventors. The bottom row defines output and costs when all patents are considered, so "% of net patents" is 100 percent by construction; "patents/\$1M" reports the net number of patents expected from a marginal investment (awarded only to grant recipients) of \$1 million; "\$/patent" reports the marginal cost expected to produce one additional patent.

	% of net	patents	\$	
	patents	\$1 M	patent	
	26	0.75	\$ 1 220 000	
	20	0.73	\$ 1,550,000	
cipients	20	0.59	\$ 1,084,000	
	14	0.40	\$ 2,476,000	
	59	1.75	\$ 572,000	
	41	1.19	\$ 839,000	
s that are				
	37	1.10	\$ 909,000	
	40	1.17	\$ 853,000	
	23	0.67	\$ 1,496,000	
	100	2.94	\$ 340,000	

TABLE 3—SUMMARY OF OUTPUTS AND COSTS

Additional result: "Value" a slightly closer look at externality (but still var from externality)

FIGURE 4. SHARE OF NET PATENT VALUE CAPTURED BY DIFFERENT FIRMS AND INVENTORS

Additional result: Identifying spillovers paper trails are very misleading

But! some (very difficult) unanswered questions

"Externalities" versus "Spillovers"

- How much value do scientists appropriate?
- How does this vary ex-ante (at time of investment) vs. ex-post (after discovery)?

• Dynamics

• What is the time between investment and payoff and what determines this?

Heterogeneity

• What are the specific, economic fundamentals of technologies that lead to larger/smaller externalities and/or spillovers?

Scientists as choosers preferences and adjustment costs

Aside: Estimating Demand in Science

We are often focused on scientists' (demand) choices

- And these choices can often be formulated as a discrete choice problem
 - What science to study?
 - What collaborator to work with?
 - What journal to submit to?
- Estimate or motivate (or both)

• What results to report? [note: continuous things here too; e.g., p-hacking)

• e.g., Krieger, Myers, & Stern. "How Important is Editorial Gatekeeping? Evidence from Top Biomedical Journals" Review of Economics and Statistics (forthcoming).

Often, scientists' "demand" = "entry"

- Standard IO market entry model
 - <u>Decision-maker</u>: scientists
 - <u>Competition</u>: other scientists
 - <u>Market</u>: geographic location; science space
 - Market features: consumer demand; fixed & variable costs of entry
- See:
 - Journal of Economics (2006).
 - Journal of Business & Economic Statistics (2010).

RAND Journal of Economics Vol. 39, No. 3, Autumn 2008 pp. 617–635

Academic freedom, private-sector focus, and the process of innovation

Philippe Aghion*

Mathias Dewatripont**

and

Jeremy C. Stein***

We develop a model that clarifies the respective advantages and disadvantages of academic and private-sector research. Rather than relying on lack of appropriability or spillovers to generate a rationale for academic research, we emphasize control-rights considerations, and argue that the fundamental tradeoff between academia and the private sector is one of creative control versus focus. By serving as a precommitment mechanism that allows scientists to freely pursue their own interests, academia can be indispensable for early-stage research. At the same time, the private sector's ability to direct scientists toward higher-payoff activities makes it more attractive for later-stage research.

Stern (2004): The model scientists' utility and firm profits from a job

Scientist utility: $U_{ii} = \alpha \gamma_i \mathbf{1} \{ \text{science}_{ij} \} + w_{ij}$ Firm profits: $\pi_{ij} = \beta \gamma_i \mathbf{1} \{ \text{science}_{ij} \} - w_{ij} - \delta \mathbf{1} \{ \text{science}_{ij} \}$

- Scientist's taste for science: α
- Firm's revenues from science: β
- Scientist's ability: γ_i
- Job's scientific orientation: science_{ii}, 1=yes, 0=no
- Wage: W_{ij}
- Firm's cost of science: δ

Stern (2004): The model equilibrium wages

$w_{ij}^* = \gamma_i + \gamma_i (\phi$

- Scientist's taste for science: $\boldsymbol{\alpha}$
- Firm's revenues from science: β
- Scientist's ability: γ_i
- Job's scientific orientation: science_{*ij*}, 1=yes, 0=no
- Wage: W_{ij}
- Rent-splitting parameter (share going to scientists): $\phi \in (0,1)$

$$(\beta - \alpha) \mathbf{1} \{ \text{science}_{ij} \}$$

Stern (2004): The model firm's decision to do science

$1\{\text{science}_{ii}\} = 1$ *i*

- Firms offer more science when, ceteris paribus:
 - scientists are higher quality
 - when cost of science (δ) is low
 - when share of quasi-rents captured by scientists (ϕ) is low
 - when revenue from science (β) is high
 - when taste for science (α) is low

iff
$$\gamma_i > \frac{\delta}{(1-\phi)(\beta-\alpha)}$$

The model and regression equilibrium wages

 $w_{ii}^* = \gamma_i + \gamma_i (\phi \beta - \alpha) \mathbf{1} \{ \text{science}_{ij} \}$

- **Regression**: $w_{ii}^* = \theta_0 + \theta_s \mathbf{1}\{\text{science}_{ij}\} + \epsilon_{ij}$
- **Problem:** 1{science_{*ij*}} may be corr. with γ_i which is corr. with w_{ii}^*
 - $\Rightarrow \mathbf{1}$ {science_{*ij*}} may be corr. with ϵ_{ii}

The model and regression equilibrium wages

$$w_{ij}^* = \gamma_i + \gamma_i (\phi)$$
$$= \gamma_i \left(1 + (\phi)\right)$$

 $\beta - \alpha$) **1**{science_{*ii*}} $b\beta - \alpha$) **1**{science_{*ii*}})

Regression w/ FE: $w_{ij}^* = \theta_i + \theta_s \mathbf{1} \{ \text{science}_{ij} \} + \epsilon_{ij}$ $\theta_{s} \propto (\phi \beta - \alpha)$

Key assumptions behind connection between empirical model

- Observed offers are equally "serious" [tried to get "final round" offers]
- Multiple-offer scientists are representative of single-offer scientists [Table 6A]
- Firms have equal view of scientists' quality γ_i [survey design]

Recall: 1{science_{*ij*}} = 1 *iff* $\gamma_i > \frac{1}{(1-\phi)(\beta-\alpha)}$

$$\delta$$

Key: Conditional on γ_i , variation in scientific orientation of offer is driven by...

Requests For Applications (RFAs) an example

Title: Development of New Technologies Needed for Studying the Human Microbiome (R01)

Announcement Type

This Funding Opportunity Announcement (FOA) is a reissue of RFA-RM-08-026.

Request for Applications (RFA) Number: RFA-RM-09-008

Key Dates

Release/Posted Date: July 16, 2009 Opening Date: August 14, 2009 (Earliest date an application may be submitted to Grants.gov) Letters of Intent Receipt Date(s): August 17, 2009 NOTE: On-time submission requires that applications be successfully submitted to Grants.gov no later than 5:00 p.m. local time (of the applicant institution/organization). Application Due Date(s): September 14, 2009 Peer Review Date(s): February-March 2010 Council Review Date(s): May 2010 Earliest Anticipated Start Date(s): July 2010 Additional Information To Be Available Date (Activation Date): Not Applicable Expiration Date: September 15, 2009

Requests For Applications (RFAs) an example

Executive Summary

- sequences, which in turn will aid in the analysis of the complex microbial populations resident in and on the human body.
- scope, <u>RFA-RM-09-009</u> that solicits applications under the R21 mechanism.
- funds and the submission of a sufficient number of meritorious applications.
- duration of each award will also vary. Applicants for R01 grants may request a project period of up to 3 years.

• Purpose. The purpose of this FOA is to solicit applications to develop new and improved technologies for obtaining samples of individual microbial isolates or strains, from the human microbiota, suitable for complete genomic sequence analysis. The goal is to expand the number of "reference" microbial genome

• Mechanism of Support. This FOA will utilize the NIH Research Project Grant (R01) grant mechanism and runs in parallel with a FOA of identical scientific

• Funds Available and Anticipated Number of Awards. \$2 million is available in FY10 for this FOA and the parallel R21 FOA in combination. It is anticipated that 2-4 R01 grants (of duration up to 3 years) and 2-6 R21 grants will be awarded. Awards issued under this FOA are contingent upon the availability of

• Budget and Project Period. Because the nature and scope of the proposed research will vary from application to application, it is anticipated that the size and

Requests For Applications (RFAs) an example

RESEARCH SCOPE: The interpretation of metagenomic sequence data is greatly aided by comparison to the genomic sequence of isolated species and genetically different strains of the same species. Yet, only a small proportion of the microbial species resident in or on the human body has been isolated and sequenced. The purpose of this FOA is to support the development of technologies that will allow the determination of the complete, individual genome sequences of substantial numbers of previously uncharacterized members of the human microbiota, to aid in the interpretation of metagenomic datasets obtained from sampling the human body. The following list, which is certainly incomplete, presents examples of strategies that would be supportable under this FOA:

- microbiota that satisfy a specified set of criteria.
- priority.
- fidelity (e.g., complete coverage, low bias, low chimerism).
- "rare" members).
- should be developed in conjunction with associated methods such as those described above.

• Development of methods to isolate single microbial cells. These methods would enable the identification, analysis and isolation of individual cells in the human

• New approaches to obtain pure cultures or simple mixed cultures of small numbers of previously uncultivated species would advance the objective of genomic analysis of the human microbiota. Proposed methods that can be applied to a large number of species rather than to any one particular species will take high

• Development, optimization and validation of methods to isolate, amplify, or clone unamplified or amplified DNA of whole genomes from individual cells at high

• Development of methods to "normalize" the complexity of the population, at either the cellular or DNA level. Such methods would facilitate either the ability to isolate single cells that are rare within a population, or to perform bioinformatics analysis on metagenomic sequences (e.g., by improving the representation of

• Development of methods to enrich the cells of a given species to essential purity. This is the inverse of reducing redundancy, and might be most effective for species whose abundance is already high. Such methods might substitute, at least for DNA sequencing studies, for the ability to establish pure cultures. • Development of methods that (as a prelude to isolating single microbial cells, or conducting enrichment or normalization) disaggregate cells from the complex mixtures of microbial cells, human cells, and extracellular materials (e.g., biofilms) that comprise human microbial samples. Methods for cell disaggregation

RFAs don't appear to target "hot" topics regression results

Scientists like being "close" to "big" RFAs raw data

Panel A. RFA-scientist similarity

Notes: The figure shows binned scatterplots of entry probabilities per panel A, similarity of scientists' prior publications to the research objectives of the RFA (larger scores indicate greater overlap), and panel B, the amount of funds made available in the RFA. The figure is based on approximately 110,000 scientists and 390 RFAs. Note the log scale of the y-axis.

Panel B. RFA funds available

FIGURE 1. PROBABILITY OF RFA ENTRY PER SIMILARITY AND FUNDING

Measuring Scientific Similarity (and communicating it too)

Figure III.6: pmra Distribution: Economics Examples

Adjustment Costs could be Large! but, are they policy-relevant?

- Two major channels at the NIH:
 - "Investigator-initiated" / "open": propose (almost) whatever you want
 - RFAs: propose something within the scope of objectives
- If adjustment costs are first-order and there aren't a ton of scientists close to each RFA, then in equilibrium:
 - Scientists will see the RFAs and compare the extra adjustment costs relative to the extra expected payoff
 - But, they will never fully dissipate all (expected) rents in the RFAs
 - And, the size of those rents will equal the adjustment costs

Expected Costs and Benefits RFAs versus Open channels

A Simple Entry Model to Estimate Adjustment Costs handling competitive expectations

- **Concern**: If scientists like RFAs that are bigger (\$) ...
 - ... scientists will know that RFAs with larger "purses" will attract many others ... • ... which increases competitive expectations ...
- - ... which could mute the effect of purse size on Pr(apply)
- **Concern**: If scientists like RFAs that are (scientifically) similar...
 - ... scientists will know that RFAs in dense areas will attract many others ...
 - ... which increases competitive expectations ...
 - ... which could mute the effect of scientific similarity on Pr(apply)

A Simple Entry Model handling competitive expectations (Bajari et al. 2010)

- Estimate scientists' expectations of how many others will enter:
 - $Pr(Entry_{ii}) = a + \beta Similarity_{ii} + \gamma Purse_i + \epsilon_{ij}$
 - $\mathbf{E}[\Pr(Entry_{ii})] = \hat{a} + \hat{\beta}Similarity_{ii} + \hat{\gamma}Purse_i$

$$\widetilde{n}_{ij} = \sum_{i' \neq i} \left(\widehat{a} + \widehat{\beta} Similarity_{i'j} + \widehat{\gamma} \right)$$

- Estimate scientists' own probability of entering, given these expectations:
 - $Pr(Entry_{ij}) = \alpha + \sigma Similarity_{ij} + \phi Purse_j + \delta \tilde{n}_{ij} + \varepsilon_{ij}$

 $Purse_i$)

Results: Entry Model

RFA controls Scientist fixed effects

Notes: All models include 20,221,541 scientist-RFA (ij) pair observations, where the mean entry probability is 5.47×10^{-4} . Independent variables are standardized in regression, so coefficients indicate the change in entry probability associated with a one standard deviation increase in the variable; all coefficients are scaled by 10^{-4} .

			Y Y	Y Y	

The Elasticity of Science from entry model parameters to adjustment costs

- Estimate scientists' own probability of entering, given these expectations:
 - $Pr(Entry_{ij}) = \alpha + \sigma Similarity_{ij} + \phi Purse_j + \delta \tilde{n}_{ij} + \varepsilon_{ij}$
 - $\sigma \equiv \partial \Pr(Entry) / \partial Similarity$
 - $\phi \equiv \partial \Pr(Entry)/\partial Purse$
- Elasticity of science: the percent change in scientific similarity that can be induced with a percent change in (expected) funding

• EoS:
$$\frac{\sigma/S}{\phi/P}$$

How much \$ does it take? elasticity of science ≈ 0.1

Panel D. Costs of inducing redirections

Are re-directions persistent?

Summary & Take-aways Myers (2020). "The Elasticity of Science"

• The adjustment costs of modern (biomedical-like) science are very large

- In both absolute terms, and relative to current grant sizes
- Targeted funding mechanisms:
 - Give rents to scientists who apply
 - Cause significant changes in trajectory for winners
 - Cause as many (if not more) total publications compared to "open" channels
 - \Rightarrow there could be a pseudo-deadweight-loss of intervening in science with \$
 - [caveat: on the scale of how RFAs are used at the NIH in this period]
 - [caveat: don't forget Sampat (2012) Hegde & Sampat (2015)]
Diversity and **Technological Progress Daron Acemoglu**

The Rate and Direction of Inventive Activity Revisited (2011)

Simple Model: Setup Acemoglu (2011)

- Two periods $t = \{1,2\}$; no discounting
- Two technologies j (sellable at t = 1) and
 - Sellable ("active"): if scientist makes improvement, they're rewarded
 - At t = 1, "quality" of both technologies
- A scientist as 1 unit of time, can devote some share x to studying tech.
 - Quality of tech. improves with prob. h(x); h() is concave and well-behaved
 - Improvement moves quality from 1 to (1 + λ), where $\lambda > 0$
 - Receive payoff of $(1 + \lambda)$ if successful

$$j'$$
 (un-sellable at $t = 1$)

Expected payoff

- x_j : scientists share of effort devoted to tech. *j* (note: $x_{j'} = 1 x_j$)
 - v: prob. other scientist wins in either tech.
 - p : prob. of switch from tech. j to j^\prime

$$\pi(x_j) = \underbrace{h(x_j)}_{\text{prob. } \text{min} j} \times \underbrace{(1+\lambda)}_{\text{payoff}} + \underbrace{h(x_j)[(1-v)(1-p)]}_{\text{prob. still winner}} \times \underbrace{(1+\lambda)}_{\text{payoff}} \\ \text{win} j \quad \text{in} t = 1 \\ \text{worder and shift} \quad \text{in} t = 2 \\ + \underbrace{h(1-x_j)[(1-v)p]}_{\text{prob. } \text{win} j'} \times \underbrace{(1+\lambda)}_{\text{payoff}} \\ \text{min} t = 2 \\ \text{min} t$$

Invest more in active tech. when "competition" is stronger

- Examples of v in practice?
 - Actual competition from other scientists
 - Knowledge / skill / ability / etc.
 - Fixed costs

Comparative static

 x_i^* is increasing in v (= prob. other scientist wins)

Social Planner's Expected Payoff (it doesn't matter who wins)

$\Pi(x_i)$

$$= h(x_j)[(1 + (1 - v)(1 - p)(1 + \lambda)) + v(1 - p)(1 + \lambda)^2]$$
private returns in j social returns in j
$$h(1 - x_j)[[(1 - v)p(1 + \lambda)) + vp(1 + \lambda)^2]$$
private returns in j' social returns in j'

• Social planner wants more effort in the alternative tech. (j') than scientist does

- Comparative static
 - Invest more in active tech. when "competition" is weaker, i.e., $\partial x_i^{social*}/\partial v < 0$
 - Recall, the opposite is true for the scientists' problem

 \Rightarrow Wedge between private and social optimum grows with "competition"!

Counter-acting forces that push against distortionary profit-seeking

- Adjustment costs
- Forecast (belief) differences
- Technology-specific competencies or preferences

- be valuable in the future!
- lacksquaresocially optimal adjustment costs?

• In other words, getting "stuck" in a certain field is great if your field happens to

<u>Thesis I'd love to see: how close are observed adjustment costs of science to the</u>

Kortum's Comment (in the same volume)

- Kortum: what about differing returns to scale?
- learning from more scientists?

In Acemoglu, early progress in non-active tech. quickly becomes superseded

• How large are the dis-incentives from competition relative to the incentives from

• Is separating these forces from the aggregate returns to scale policy-relevant?

The Economics of Science an empiricist's view

Kyle R. Myers <u>kmyers@hbs.edu</u> Innovation Research Boot Camp, Summer 2024
